Fiscal Year 2010

HOMELAND SECURITY GRANT PROGRAM

SUPPLEMENTAL RESOURCE: CYBER SECURITY GUIDANCE

December 2009
CYBER SECURITY GUIDANCE

With the pervasiveness of information technology (IT) and cyber networks systems in nearly every aspect of society, effectively securing the Nation’s critical infrastructure requires investments in network resiliency as well as cyber infrastructure protection. As all levels of government now rely on cyber networks and assets to provide National security, public safety, and economic prosperity, their operations depend on information systems that are maintained, protected, and secured from exploitation and attack. In recognition of this importance, President Barack Obama has identified the digital infrastructure as a strategic National asset.

The increasing frequency and sophistication of cyber attacks on critical infrastructure and key resources (CIKR) requires planning across all State, local, tribal, and territorial (SLTT) homeland security components to develop robust strategies to prepare for and respond to events that can degrade or destroy SLTT governments’ abilities to deliver essential services to citizens and prepare for the impact of terrorist or criminal activity or natural disaster.

“Many of the Nation’s essential and emergency services, as well as our critical infrastructure, rely on the uninterrupted use of the Internet and the communications systems, data, monitoring, and control systems that comprise our cyber infrastructure. A cyber attack could be debilitating to our highly interdependent CIKR and ultimately to our economy and national security.”

Nation-states, criminal organizations, terrorists, and other malicious actors conduct attacks against critical cyber infrastructure on an ongoing basis. According to the National Institute of Standards and Technology (NIST) National Vulnerability Database, 6,608 new computer vulnerabilities were catalogued in 2006; 6,516 in 2007; and today the database continues to increase at a rate of 11 vulnerabilities published per day. The impact of a serious cyber incident or successful cyber attack would be devastating to SLTT governments’ assets, systems, and/or networks; the information contained therein; and the confidence of those who trust governments to secure those systems.

SLTT planning should incorporate intra-state coordination with sound assessment and mitigation practices to drive development and maintenance of robust cyber security capabilities within the All-Hazards framework of homeland security. To effectively address the security of SLTT cyber assets, consider the following preparedness measures:

- The degree to which government IT, communications, and cyber infrastructures provide operational support for the systems on which State essential services, including Homeland Security, function
- How a loss or degradation of these systems would hinder homeland security operations and essential functions
How state preparedness and response efforts benefit from assessments of threats and vulnerabilities to these systems as well as the analysis of the malicious and potentially illegal activity occurring on them

As a means to guide these efforts, State Administrative Agencies (SAA), security officials, and authorities at all levels of government should review cyber infrastructure and assets based on appropriately tailored vulnerability assessments. Doing so will better enable coordinated investments and protective measures, increasing return on investment and overall security.

This Annex outlines parameters for SLTT government officials to coordinate preparedness planning efforts to ensure cyber security investments are considered and supported in long term development considerations. Potential grantees should review the guidance provided below prior to submitting proposals and discuss how to apply it to SLTT planning with cyber security and IT leadership (i.e., Chief Information Officer, Chief Information Security Officer, etc.). This due diligence will ensure that grantees amply address their cyber security goals and objectives and assess current activities to bolster the security of state computer network enterprises.

A. The Role of Cyber Systems

IT network infrastructure enables the functions and services of all sectors, resulting in a highly interconnected and interdependent global CIKR network. The U.S. Department of Homeland Security (DHS) is leading efforts to engage and work with security partners at the State and local level, as well as in the private sector and academia, to ensure that the cyber elements of critical infrastructure are robust, responsive, and resilient. As such, State planning should consider the full scope of cyber assets and network infrastructure in mission critical systems that support incident response and emergency management, physical security protection, law enforcement and intelligence gathering, and other State homeland security functions. For example:

- Malicious activity originating in cyberspace can affect physical system components and potentially lead to property damage and loss of life. Aligning State and local cyber incident response activity to National policies and protocols, and assigning responsibility to a central authority will ensure a uniform, coordinated response to any such event
- Shifting to Internet protocol (IP) networks for such services as interoperable emergency communications and 911 systems provides State and local responders with new capabilities for prevention, response, and recovery. It also

## Cyber infrastructure

includes electronic information and communications systems, and the information contained in those systems. Computer systems, control systems such as Supervisory Control and Data Acquisition (SCADA) systems, and networks such as the Internet are all part of cyber infrastructure.

— National Infrastructure Protection Plan (NIPP), 2006
Degradation or disruption of IT and communications functions can inhibit execution of continuity of governance or continuity of operations plans following a catastrophic event or other physical security incident. Accounting for redundant and alternative systems for supplying essential functions in emergency response planning reduces “down time” on critical systems.

Other infrastructures, including transportation, water treatment, electric power, and other control systems-based elements owned and operated by States and municipalities are vulnerable.

State and local Fusion Centers rely on IP networks to communicate vital data for tactical and operational decision-making. The failure of IT networks could hamper analysis of a developing crisis, hurting decision making at critical junctures, especially if errors coincide with a larger man-made or natural disaster.

Malicious and criminal activity online against government systems and assets can accompany criminal activity in the physical world. Information on such activity can contribute greatly to law enforcement investigations and prosecutions and should be available to SLTT law enforcement entities.

Effectively addressing cyber threats to the SLTT enterprise requires situational awareness across the multiple systems and coordination by a central authority. Two-way sharing of information on malicious activity and cyber attacks significantly contributes to situational awareness as well as appropriate response measures.

B. Building Capabilities and Allowable Costs

Establishing cyber security as a primary target capability in preparedness planning provides the foundation on which to build operational functions in cyber response and recovery, and enhanced coordination of activities though all levels of government. As such, funds from each of the fiscal year 2010 Homeland Security Grant Program (HSGP) components – State Homeland Security Program, Urban Areas Security Initiative, Metropolitan Medical Response System, and Citizen Corps Program – can be used to invest in functions that support and enhance SLTT cyber security programs.

- **Equipment:** Expenditures that cover a wide range of investments including network protection, intrusion detection, and encryption technologies. More information on the DHS Approved Equipment List, including a breakdown of Cyber Security Enhancement Equipment, is available on the Responder Knowledge Base, [www.rkb.us](http://www.rkb.us)

- **Planning:** Each SLTT government entity should develop and implement a comprehensive cyber security approach to manage cyber risk that is fully incorporated into overall State homeland security plans and operations. The plans should be reviewed and updated on a periodic basis to address technology and vulnerability changes, cover the full scope of threats facing State enterprises,
and account for IT and computer systems owned and operated by all State, regional, local, tribal, and territorial governments

- **Training:** Expanding government employees knowledge of cyber threats and security measures and well as enhancing capabilities of existing IT and cyber security staff contributes to overall security posture of the government enterprise. Information on various training courses is available at [www.nw3c.org](http://www.nw3c.org), [www.sentinelproject.net](http://www.sentinelproject.net) and [www.fema.gov/about/training](http://www.fema.gov/about/training)

- **Exercises:** Scenarios must be based on events that adhere to State Homeland Security strategies and focus on testing and validating existing capabilities. Cyber events are unique in that they can result in physical impacts to systems that are highly localized in nature, yet be driven by anonymous actors operating outside of regional authorities

- **Personnel/Operations:** In addition to staff to support the above activities, grantees can apply for funds to hire analysts to monitor and assess the health of critical computer systems as well as coordinate information sharing and response efforts to cyber incidents

C. **Guiding Investment Decisions**

Securing cyber systems requires a layered defense that accounts for the range of security challenges facing organizations, including logical and physical threats to cyber-based systems. There are a number of resources available to help State and local security officials conduct assessments that can help inform where to allocate funding obligations to build cyber security capabilities. Resources include the National Institute of Standards and Technology (NIST) Computer Security Resource Center. NIST provides standards and technology to protect information systems against threats to the confidentiality, integrity, and availability of information and services. NIST includes guidance on securing information systems, methods for assessing the effectiveness of security requirements, and managing risk from information systems (in addition to many other topics). DHS’ National Cyber Security Division (NCSD) has established tools that draw on existing cyber security guidance and standards to assist organizations in assessing their security posture. The Cyber Security Evaluation Tool (CSET) is a DHS product that provides users with a systematic and repeatable approach for assessing the security posture of their cyber systems and networks. The CSET tool is designed to raise awareness and facilitate discussions on cyber security within an organization. It also highlights vulnerabilities in the organization’s systems and provides options for consideration on ways to address vulnerabilities. The results of the CSET assessment can be used as a starting point for making informed investment and risk-based decisions.

Organizations can use CSET results to demonstrate the degree to which they have adopted best practice in cyber security. Conversely, these organizations can use the results to document “options for consideration,” and produce a prescriptive list of security control deficiencies that require funding consideration. A risks assessment
contextualizes this information with other risk information on assets, threats, known vulnerabilities in people, process, and technology, and consequences. Once a risk assessment is complete, State and local security officials should work with State HSAs and state planning entities to ensure that identified gaps receive adequate funding for mitigation activities and equipment.

Implementing the CSET or any assessment tool/methodology for use in identifying cyber security vulnerabilities should be conducted in partnership with all State homeland security components to account for the full range of functions supported by cyber systems. Additional information on the CSET is available at ncsd_cipcs@hq.dhs.gov.

D. Conclusion

It is the recommendation of the U.S. Department of Homeland Security (DHS) that State Homeland Security Advisors, SAA’s, and all state homeland security planning entities evaluate the full scope of cyber threats and vulnerabilities to all existing and envisioned homeland security functions, systems, and procedures before applying for funding under the Homeland Security Grant Program. By incorporating assessments of the systems and assets that support State IT and cyber infrastructure, State planners can more effectively seek funding for and implement mitigation strategies for protecting critical functions, ensure ongoing delivery of services, and protect the safety and wellbeing of citizens.

It is also the recommendation of the U.S. DHS that State Homeland Security Advisors incorporate cyber security in supported and long-term development considerations. As the underpinning of most of our CIKR, cyber elements of critical infrastructure need to be robust, responsive, and resilient.

Comparing current cyber security activities with the desired level of preparedness will enable officials to identify gaps and needed enhancements that can be accounted for in investment justifications. Establishing and enhancing cyber security capabilities that are fully-integrated into ongoing state preparedness efforts provides the foundation on which to enhance collaboration and coordination from across state functions and through all levels of government in building All-Hazards capabilities. As more and more technologies are integrated into our Nation’s prevention protection, response, and recovery activities, cyber security will be an essential requirement. Investing now may help lay the foundation SLTT stakeholders need for future All-Hazards efforts.

Grantees are urged to review information provided by the following resources, which provide valuable guidance, best practices, and opportunities for support and information sharing:

- **DHS’s National Cyber Security Division** (NCSD) works collaboratively with public, private, and international entities to secure America’s cyber assets by building and maintaining an effective National cyberspace response system and implementing a cyber-risk management program for protection of critical infrastructure. It has resources that can assist State and local Governments in
bolstering their cyber security capabilities. Information is available at www.dhs.gov/xabout/structure/editorial_0839.shtml

- The **United States Computer Emergency Readiness Team** (US-CERT) is a partnership between DHS and public and private sector security partners. Established in 2003 to protect the Nation’s Internet infrastructure, it coordinates defense against and responses to cyber attacks across the Nation by collaborating with State and local Governments and sector information sharing and analysis centers (ISACs), analyzing cyber threats and vulnerabilities, and disseminating cyber threat warning information. Information is available at www.Us-Cert.gov/

- The **National Institute of Standards and Technology** (NIST) is a non-regulatory Federal agency within the U.S. Commerce Department’s Technology Administration. NIST’s mission is to develop and promote measurement, standards, and technology to enhance productivity, facilitate trade, and improve the quality of life. The NIST Information Technology Laboratory, Computer Security Division provides a variety of tips, newsletters, and publications to support cyber security efforts. Information is available at www.nist.gov

- The **National Association of State Chief Information Security Officers** (NASCIO) provides a mechanism for collaboration on security investment priorities among state CIOs and leading IT officials in the States. Through its Information Security and Privacy Committee, NASCIO identifies security-related issues that States may encounter and offers insight and effective security practices to address those issues. Topics addressed have included the security and privacy implications of emerging technologies, such as wireless technologies, the role of the Chief Information Security Officer, and insider threats. Information is available at www.nascio.org/

- The **Multi-State Information Sharing and Analysis Center** (MS-ISAC) is a focal point for information sharing on IT and cyber security between and among State and local governments. It is a voluntary and collaborative organization with participation from all 50 states and the District of Columbia that provides a common mechanism for raising the level of cyber security readiness and response in each State and with local governments. In addition, DHS has officially recognized the MS-ISAC as the National center for States to coordinate cyber readiness and response. The US-CERTand MS-ISAC exchange information regularly to facilitate National coordination of cyber security detection, prevention, and response activities. Information is available at www.msisac.org/
