

LOWEST FLOOR GUIDE

This section is to be used as a guide for identifying the lowest floor for rating buildings being considered for coverage under the National Flood Insurance Program (NFIP).

I. LOWEST FLOOR DETERMINATION

The following guidance is to be used to identify the lowest floor for rating purposes.

A. Non-Elevated Buildings

For a non-elevated building, the lowest floor used for rating purposes is the building's lowest floor including a basement or subgrade crawlspace, if any.

Attached Garage

If a non-elevated building described and rated as a single-family dwelling (including a condominium unit within a multi-unit residential building that qualifies as a single building) located in any A Zone (any flood zone beginning with the letter A) has an attached garage floor elevation at or above the Base Flood Elevation (BFE), the garage floor may be excluded from rating.

An attached garage floor elevation below the BFE can be excluded as the lowest floor for rating if the garage has no machinery or equipment below the BFE.

For rating purposes, if the garage has machinery or equipment below the BFE, the floor of the attached garage can be excluded from rating if all of the following conditions exist:

- The building is described and rated as a single-family dwelling;
- The building is located in any A Zone;
- The garage floor elevation is below the elevation of the top of the bottom floor; *and*
- The garage has proper openings (refer to Proper Openings Requirements subsection in this section of the manual).

If a building not described and rated as a single-family dwelling located in any A Zone has an attached garage, and the floor level of the garage is below the level of the building, use the garage floor as the lowest floor for rating.

B. Elevated Buildings in A Zones

An elevated building is a building that has no basement and that has its lowest elevated floor raised above ground level by foundation walls, shear walls, posts, piers, pilings, or columns. Foundation walls

are masonry walls, poured concrete walls, or precast concrete walls, regardless of height, that extend above grade and support the weight of a building. Buildings with knee foundation walls below the elevated floor (e.g., foundation walls not constructed the full height of the area between the lowest elevated floor and the grade, with wood-frame or studs attached above the foundation wall), are considered elevated buildings for rating purposes. However, if the foundation walls are supported on a slab foundation, the building is non-elevated.

Enclosure

An enclosure is the portion of an elevated building below the lowest elevated floor that is either partially or fully shut in by rigid walls. In determining whether an enclosure is finished, drywall that is mudded, taped, and painted is considered a finished wall. Drywall that is only painted is not considered to be finished. Drywall that is mudded and taped but not painted or textured is also not considered to be finished. Block walls are not considered to be finished even if they are painted. Typically a block (or concrete) wall is part of the foundation system. Painted plywood is considered to be finished.

NOTE: A crawlspace below the lowest elevated floor, and a garage below or attached to an elevated building are both considered enclosures.

Elevated No Enclosure

For an elevated building located in any A Zone (any flood zone beginning with the letter A), with no enclosure below the lowest elevated floor, the floor used for rating purposes is the lowest elevated floor.

Elevated with Enclosure

For an elevated building located in any A Zone that has an enclosure below the elevated floor, including a crawlspace or an attached garage, the enclosure or garage floor becomes the lowest floor for rating if any of the following conditions exists:

- The enclosed space is finished (having more than 20 linear feet of interior finished wall [paneling, etc.]); *or*
- The unfinished enclosed space is used for other than building access (stairwells, elevators, etc.), parking, or storage; *or*
- There is an elevator below the BFE; *or*
- The unfinished enclosed space (either the enclosure or garage) has no proper openings.

NOTE: A garage attached to an elevated building is considered an enclosure.

For an elevated building located in any A Zone that has an enclosure below the elevated floor constructed with flood-damage resistant materials (as outlined in FEMA Technical Bulletin 2), the enclosure floor becomes the lowest floor for rating if any of the following conditions exists:

- The enclosed space is used for other than building access (stairwells, elevators, etc.), parking, or storage, or
- There is an elevator below the BFE; or
- The enclosed space has no proper openings.

1. Proper Opening Requirements

An elevated building with an enclosure or crawlspace below the elevated floor with proper flood openings (flood vents) in the enclosure or crawlspace can be rated using the elevated floor as the lowest floor. (For elevated buildings with proper flood openings in an unfinished enclosure or crawlspace, the Application should indicate “None” for enclosure.) This rule applies to buildings in zones A, A1–A30, AE, AO, AH, AR, and AR Dual.

For buildings in any A Zone all enclosures (including an elevator shaft, a garage, or a crawlspace) below the lowest elevated floor must be designed to automatically equalize hydrostatic flood forces on exterior walls by allowing for the entry and exit of floodwaters. One of the following criteria must be met to satisfy this proper openings requirement for rating purposes:

- a. A minimum of 2 openings must be present, with positioning on at least 2 exterior walls, having a total net area of not less than 1 square inch for every square foot of enclosed area. The bottom of all openings must be no higher than 1 foot above the higher of the exterior or interior grade (adjacent) or floor immediately below the openings.
- b. If the enclosure floor is partially subgrade, a minimum of 2 openings must be present, with positioning on a single exterior wall adjacent to the lowest grade next to the building, having a total net area of not less than 1 square inch for every square foot of enclosed area. The bottom of all openings must be no higher than 1 foot above the higher of the exterior or interior grade (adjacent) or floor immediately below the openings.

2. Alternative to the Openings Requirement Above

For architectural or other reasons, a designer or builder may use an alternative to satisfy the

requirement for a building to have openings that provide 1 square inch per square foot of enclosed area. These alternatives, which may be referred to as “engineered openings,” must be certified as having been designed to provide automatic equalization of hydrostatic flood forces by allowing for the entry and exit of floodwaters. Design requirements and specifications for certification statements are outlined in FEMA Technical Bulletin 1-08, “Openings in Foundation Walls and Walls of Enclosures Below Elevated Buildings in Special Flood Hazard Areas,” at <http://www.fema.gov/library/viewRecord.do?id=1579>.

If engineered openings are used as an alternative, the Write Your Own (WYO) Company or NFIP Servicing Agent must obtain a copy of the following documentation for its underwriting files:

- a. For engineered openings designed for installation in a specific building, a copy of the certification is required. This certification will verify to community officials that the openings are designed in accordance with the requirements of the NFIP, applicable building codes, and accepted standards of practice. The original certification statement must include the design professional’s name, title, address, type of license, license number, the state in which the license was issued, and the signature and applied seal of the certifying registered design professional. In addition, this certification shall identify the building in which the engineered openings will be installed and it shall address the following: (1) a statement certifying that the openings are designed to automatically equalize hydrostatic flood loads on exterior walls by allowing for the automatic entry and exit of floodwaters; (2) description of the range of flood characteristics tested or computed for which the certification is valid, such as rates of rise and fall of floodwaters; and (3) description of the installation requirements or limitations that, if not followed, will void the certification; or
- b. For engineered openings for which the International Code Council Evaluation Service, Inc., has issued an Evaluation Report, a copy of the Evaluation Report is required. This report is required to assure community officials that the openings are designed in accordance with the requirements of the NFIP, applicable building codes, and accepted standards of practice. The Evaluation Report identifies the model numbers of the engineered openings addressed in the report, specifies the number of engineered openings that are required for a specified square footage of enclosed area below the BFE,

and lists installation requirements. Acceptable documentation must include the model numbers of the engineered openings, which must match the model numbers provided in the International Code Council Evaluation Report.

3. Elevated Building with Garage

a. Elevated on Crawlpace with Attached Garage

If a building elevated on a crawlpace is located in an A Zone and has an attached garage, and the main building and garage are separated by foundation walls, the garage and the crawlpace are considered separate enclosures. Each must have its own flood openings meeting the NFIP proper openings requirement in order to exclude either garage or crawlpace floor as the lowest floor for rating. If the garage and the crawlpace share two exterior walls and are not separated by a foundation wall, the garage and crawlpace form a single enclosure. Use the following guidelines to determine the lowest floor for rating:

- Use the top of the crawlpace (under-floor space) floor or the garage floor, whichever is lower, if neither the crawlpace nor the garage has proper openings; *or*
- Use the top of the crawlpace floor, if the only area that has proper openings is the garage; *or*
- Use the top of the garage floor, if the only area that has proper openings is the crawlpace; *or*
- Use the top of the finished floor (habitable floor), if both the crawlpace and the garage have proper openings.

b. Elevated with Enclosure — Garage Under the Elevated Floor

If a building is elevated with an enclosure, and the garage is located in an enclosure beneath the elevated floor, the garage area is considered to be a part of the enclosure area. It is not necessary for the garage area to have its own flood openings, as long as the openings in the enclosure as a whole meet the NFIP proper openings requirements. When a garage shares exterior walls with other enclosed areas, and there is no foundation wall between them, then the garage area is considered to be a part of the enclosed area. When the garage is separated from other enclosed areas by a foundation wall, the garage must meet the proper openings requirement separately in order to be excluded from rating.

C. Elevated Buildings in V Zones

In zones V, VE, and V1–V30, the floor of an enclosed area below the lowest elevated floor is the building's lowest floor if any of the following conditions exists:

- The enclosed space is finished (having more than 20 linear feet of interior finished wall [paneling, etc.]); *or*
- The unfinished enclosed space is used for other than building access (stairwells, elevators, etc.), parking, or storage; *or*
- The enclosed space is of any size, and there is machinery or equipment below the BFE located inside or outside the enclosed space. (Machinery or equipment is defined as building items permanently affixed to the building and that provide utility services for the building – i.e., furnaces, water heaters, heat pumps, air conditioners. Washers, dryers, and food freezers are contents items and are not considered machinery or equipment.); *or*
- There is elevator equipment below the BFE; *or*
- The enclosed space is constructed with non-breakaway walls. (A non-breakaway wall is defined as a wall that is attached to the structural support of the building and is not designed or constructed to collapse under specific lateral loading forces. This type of construction endangers the foundation system of the building.); *or*
- The enclosed space is 300 square feet or more and has breakaway walls; *or*
- The enclosed space has load-bearing (supporting) walls.

NOTE: If the enclosed space (enclosure) is at or above the BFE, use the “Free of Obstruction” rate table in the Rating or Condominiums section as appropriate. Also use these rates if an enclosure has solid load-bearing walls that provide less than 25% of the building's structural support. The elevation of the bottom enclosure floor is the lowest floor for rating (LFE).

1981 Post-FIRM V Zone With Obstruction

For Post-FIRM 1981 buildings elevated in V zones with an enclosure, the bottom of the lowest horizontal structural member is the building's lowest floor if ALL of the following conditions exist:

- The enclosure is unfinished; *and*
- The enclosure is used solely for building access, parking, or storage; *and*
- The enclosure is constructed with breakaway walls; *and*
- The enclosure is less than 300 square feet; *and*

- There is no machinery and equipment below the BFE; *and*
- There is no elevator below the BFE.

The Post-FIRM Elevated Buildings with Obstruction rate table must be used.

NOTE: Pre-1981 construction (both Pre-FIRM and Post-FIRM '75-'81) meeting the above building conditions may use the Post-1981 V zone rate tables if the FIRM used for rating is effective on or after October 1, 1981.

1981 Post-FIRM V Zone No Obstruction

For Post-FIRM 1981 buildings elevated in V zones with no enclosure, the bottom of the lowest horizontal structural member is the building's lowest floor using the 1981 Post-FIRM Elevated Building without Obstruction rate table.

NOTE: Pre-1981 construction (both Pre-FIRM and Post-FIRM '75-'81) meeting the above building conditions may use the Post-1981 V zone rate tables if the FIRM used for rating is effective on or after October 1, 1981.

D. Hanging Floors (A Zones and V Zones)

A hanging floor is a walled-in floor area beneath an elevated building which does not extend to the ground. A hanging floor includes foyers or mid-level entries that are walled-in and beneath an elevated building, and has a floor which does not extend to the ground. In A Zones, the top of the hanging floor is considered the lowest floor for rating. In V Zones, the bottom of the hanging floor's lowest horizontal structure member is considered the lowest floor for rating. A building that includes a hanging floor must be described as an elevated building. Buildings with hanging floors can be submitted for Special Rates consideration.

II. USE OF ELEVATION CERTIFICATE

The Elevation Certificate (EC) is used to establish the rates for buildings located in Special Flood Hazard Areas (SFHA) with full-risk rates. Use the criteria below in determining whether use of the EC is mandatory or optional. (See the Special Certifications section for more information on using the EC.)

A. Mandatory Use of Elevation Certificate

An EC is required to determine the full-risk premium rate for all Post-FIRM buildings rated in zones Unnumbered A, AE, A1–A30, VE, and V1–V30. An EC is also required for Post-FIRM buildings located in Unnumbered A Zones (With or Without BFE) and Zones AH and AO. In

Zone AO, a Letter of Compliance is acceptable in lieu of an EC.

In unnumbered A zones, when there is no BFE, the property owner or the property owner's representative may complete the EC without providing data in Section C or D. If the building is located in an unnumbered A Zone, and the community has established a BFE, an EC completed by a licensed land surveyor, architect, or engineer that certifies the lowest floor elevation in Section C and D must be submitted.

Pre-FIRM buildings insured with continuous coverage with an original new business date prior to July 6, 2012, may use Optional full-risk rates determined with an EC. Pre-FIRM buildings newly insured or newly purchased on or after July 6, 2012, in zones Unnumbered A, AE, A1–A30, AH, AO, VE, and V1–V30 must be rated with full-risk premium rates determined with an EC. Additionally, coverage reinstated effective on or after October 4, 2012, following a lapse in coverage for a policy previously receiving Pre-FIRM subsidized premium rates must be rated with full-risk premium rates determined with an EC.

B. Optional Rating Using the Elevation Certificate

Buildings located in AR and AR Dual Zones, or constructed prior to publication of the initial Flood Insurance Rate Map (Pre-FIRM), can, at the option of the insured, be elevation-rated with an EC. The insured may select the more advantageous rate.

C. Guidelines for Determining the Conversion from NGVD 1929 to NAVD 1988

NAVD 1988 is replacing NGVD 1929 as the national standard reference datum for elevations. To determine the conversion from NGVD to NAVD, contact the community official. The surveyor may have applied the conversion factor to the elevations entered on the EC. Unless the surveyor's comments specifically state that the conversion was not performed, assume that line items C2.a–h have already been converted to the same elevation datum as the BFE reported in box B9. Following this guidance will ensure consistent application at the policy processing level.

If the surveyor has not applied the conversion factor, the National Geodetic Survey (NGS) has developed a tool that will help you convert the LFE and BFE measurements to like form. This tool is available through the NGS website at http://www.ngs.noaa.gov/cgi-bin/VERTCON/vert_con.prl. Enter the north latitude and west longitude of the structure. Enter "ft" in the orthometric height field. The conversion factor will then be provided for calculations.

For example, to convert a property with a latitude of 35° 15' and longitude of 121° 22' 30" from NGVD 29 to NAVD 88, enter the latitude and longitude in the degrees, minutes, seconds format (just replace the °, ', " symbols with a space).

Enter the elevation to be converted in NGVD 29 (e.g., top of bottom floor, top of next-higher floor, bottom of lowest horizontal structural member, or lowest adjacent grade next to the building). If the elevation is measured in feet (most places other than Puerto Rico), be sure to include "ft" after the elevation so that the results will be in feet.

As an example, enter a building elevation of 54.2 ft. Select Vertical Datum NGVD 29 and click on Submit.

The result produced by VERTCON for this latitude and longitude will display a conversion factor of 2.726 feet and a building elevation of 56.926 feet NAVD 88. Shown in tenths of a foot, the building elevation is 56.9 feet NAVD 88.

To convert a property from NAVD 88 to NGVD 29, enter data as above. Be sure to select Vertical Datum NAVD 88, then click on Submit. The result produced by VERTCON shows a conversion factor of 2.726 feet. Use the building elevation of 54.2 ft. The building elevation in NGVD 29 is 51.474 feet. Shown in tenths of a foot, the building elevation is 51.4 feet NGVD 29.

PUTTING IT INTO PERSPECTIVE....

Section A and C of the 2012 Elevation Certificate provide fields for entering numerous measurements that the surveyor must record in completing an elevation survey. This data will be used to not only help insurance agents accurately rate a flood insurance policy, but also assist FEMA and the local communities with their floodplain management compliance issues. This 2012 Elevation Certificate does not specifically identify for the insurance agent the Lower Floor Elevation that must be used for rating purposes. Based upon your knowledge of the rules and regulations of the National Flood Insurance Program, you must make the final determination regarding which elevation should be used to accurately rate the policy and calculate the premium. This guide must be used in conjunction with information provided on the Flood Insurance Application form.

This guide will provide you with some helpful information and hints.

WHERE TO START.....

The following are some suggested guidelines for interpreting the elevation information in Section C:

STEP 1:

Review the Elevation Certificate. Find the referenced Building Diagram Number in Section A, Item A7. This diagram number refers to one of the building diagrams located on Instructions Pages 7 through 9 of the Elevation Certificate.

STEP 2:

Once the correct building diagram has been determined, review the data contained in Section C, Item C2 of the Elevation Certificate. The circled letters and numbers on the building diagram correspond to the elevations entered in Items C2.a-h in Section C, Item C2. Check the Lowest Floor Guide found on the inside of this brochure as well as in the Flood Insurance Manual.

STEP 3:

Review the elevation in Item C2.a. If the elevation in Item C2.a is lower than the elevation in Item C2.f, then you have a building with a basement. The correct lowest floor elevation for rating will be Item C2.a (Building Diagrams 2, 4, or 9).

- For Building Diagrams 1A, 1B, and 3, if Item C2.a is higher than C2.f, the building is slab on grade, or a

walkout first level. Rate as no basement and use Item C2.a as the lowest floor elevation for rating.

- If Item C2.c is given, and the property is in a V Zone, Item C2.c will be the correct lowest floor elevation for rating if there are no enclosures (Building Diagram 5).
- If Item C2.c is higher than Item C2.a, then you have an elevated building with enclosure(s) below the elevated level. Use Item C2.c as the lowest floor elevation for rating V Zones if the enclosure is less than 300 sq. ft., the walls are breakaway, and machinery and equipment are elevated at or above the BFE. Otherwise use the bottom of Item C2.a if the enclosure is 300 sq. ft. or greater, or the walls are supporting walls, or machinery and equipment are below the BFE and an enclosure of any size exists (Building Diagram 6).

IMPORTANT HINT:

- If Item A8 and/or Item A9 shows flood openings, and the openings are adequate for the square footage of the enclosed area, then you have an elevated building with proper venting. The lowest floor elevation for rating is Item C2.b, top of the next higher floor, as long as the building is not located in a V Zone (Building Diagrams 7 and 8).

WHERE TO GET HELP

The Lowest Floor Guide will assist you in determining the lowest floor for rating purposes for the majority of your business. However, if you are unable to make the determination, contact your WYO Company underwriting staff or, for NFIP-direct policies, the NFIP Servicing Agent underwriting department for assistance.

Lowest Floor for Rating: Difference between the top of the bottom floor and highest adjacent grade

Elevation Needed for Rating from FEMA Elevation Certificate: Use the measurement provided in Item E1. If the top of the bottom floor is below the highest adjacent grade, show this difference as a negative number on the application. For buildings similar to diagrams 6-9 with proper openings, use the measurement provided in Item E2.

*Note: A floor that is below ground level (grade) on all sides is considered a basement even if the floor is used for living purposes, or as an office, garage, workshop, etc.

Distinguishing Feature: The area below the elevated floor is enclosed, either partially or fully. In A Zones, the partially or fully enclosed area below the elevated floor is with or without openings** present in the walls of the enclosure.

Lowest Floor for Rating: Lowest elevated floor or top of bottom floor if conditions in the Flood Insurance Manual are met

Elevation Needed for Rating from FEMA Elevation Certificate:
Item C2.a or Item C2.b

All buildings elevated on full-story foundation walls with a partially or fully enclosed area below the elevated floor. This includes walkout levels, where at least one side is at or above grade. The principal use of this building is located in the elevated floors of the building.

BUILDING DIAGRAM #8

Distinguishing Feature: The area below the first floor is enclosed by solid or partial perimeter walls. In A Zones, the crawlspace is with or without openings** present in the walls of the crawlspace.

Lowest Floor for Rating: Next higher floor or top of bottom floor if conditions in the Flood Insurance Manual (Lowest Floor Determination) for A zones are met

Elevation Needed for Rating from FEMA Elevation Certificate:
Item C2.a or Item C2.b

All buildings elevated on a crawlspace with the floor of the crawlspace at or above grade on at least one side, with or without attached garage.

BUILDING DIAGRAM #9

Distinguishing Feature: The bottom (crawlspace) floor is below ground level (grade) on all sides.* (If the distance from the crawlspace floor to the top of the next higher floor is more than 5 feet, or the crawlspace floor is more than 2 feet below the grade (LAG) on all sides, use Diagram 2.)

Lowest Floor for Rating: Top of subgrade crawlspace

Elevation Needed for Rating from FEMA Elevation Certificate:
Item C2.a or Item C2.b

All buildings (other than split-level) elevated on a subgrade crawlspace with or without attached garage.

**An "opening" is a permanent opening that allows for the free passage of water automatically in both directions without human intervention. Under the NFIP, a minimum of two openings is required for enclosures or crawlspaces. The openings shall provide a total net area of not less than 1 square inch for every square foot of area enclosed, excluding any bars, louvers, or other covers of the opening. Alternatively, an Individual Engineered Flood Openings Certification or an Evaluation Report issued by the International Code Council Evaluation Service (ICC ES) must be submitted to document that the design of the openings will allow for the automatic equalization of hydrostatic flood forces on exterior walls. A window, a door, or a garage door is not considered an opening; openings may be installed in doors. Openings shall be on at least two sides of the enclosed area. If a building has more than one enclosed area, each area must have openings to allow floodwater to directly enter. The bottom of the openings must be no higher than 1 foot above the higher of the exterior or interior grade or floor immediately below the opening. For more guidance on openings see NFIP Technical Bulletin 1.

All buildings elevated on a crawlspace with the floor of the crawlspace at or above grade on at least one side, with or without attached garage.

BUILDING DIAGRAM #9

Distinguishing Feature: The bottom (crawlspace) floor is below ground level (grade) on all sides.* (If the distance from the crawlspace to the top of the next higher floor is more than 5 feet, or the crawlspace floor is more than 2 feet below the grade (LAG) on all sides, use Diagram 2.)

Lowest Floor for Rating: Bottom of subgrade crawlspace

Elevation Needed for Rating from FEMA Elevation Certificate:
Item C2.a. and Item C2.b.

All buildings (other than split-level) elevated on a subgrade crawlspace with or without attached garage.

*Note: A floor that is below ground level (grade) on all sides is considered a basement even if the floor is used for living purposes, or as an office, garage, workshop, etc.

***Use Item C2.c if available; otherwise subtract 12 inches from Item C2.a for one-to-four family residences. For buildings other than one-to-four family residences subtract 18 inches from Item C2.a.
