

Public Assistance Guidance on Inundated and Submerged Roads

FEMA Policy FP 104-009-13

BACKGROUND

Section 1228 of the Disaster Recovery Reform Act (DRRA) of 2018¹ directs the Federal Emergency Management Agency (FEMA), in coordination with the Federal Highway Administration (FHWA), to develop guidance regarding Federal assistance through the FEMA Public Assistance (PA) grant program for the restoration of inundated and submerged roads damaged or destroyed by a declared major disaster. Section 1228 of the DRRA is provided below:

The Administrator of the Federal Emergency Management Agency, in coordination with the Administrator of the Federal Highway Administration, shall develop and issue guidance for State, local, and Indian tribal governments regarding repair, restoration, and replacement of inundated and submerged roads damaged or destroyed by a major disaster, and for associated expenses incurred by the Government, with respect to roads eligible for assistance under section 406 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act (42 U.S.C. 5172).

FEMA developed this policy in coordination with FHWA. The policy is consistent with the Robert T. Stafford Disaster Relief and Emergency Act² (Stafford Act); FHWA's Emergency Relief Program under Section 125 of the United States Code; Part 668 of Title 23 of the Code of Federal Regulations; and the FHWA Emergency Relief Manual.³

PURPOSE

The purpose of this policy is to clarify the eligibility of public roads inundated by flood waters directly related to a major disaster declared under the Stafford Act. This policy is in effect for all major disasters declared on or after January 1, 2016.⁴ More information on the eligibility of roads as part of the PA program is available in the Public Assistance Program and Policy Guide (PAPPG).⁵

PRINCIPLES

A. Provide clear guidance on the eligibility of roads for which disaster damage is claimed due to flood water inundation as a direct result of a Federally-declared major disaster.

¹ Div. D of P.L. 15-254.

² P.L. 93-288, as amended, 42 U.S.C. 5121 § *et seq.*

³ www.fhwa.dot.gov/reports/erm/er.pdf.

⁴ Except for amendments to the Stafford Act, DRRA's provisions are retroactive to January 1, 2016. DRRA § 1202(b).

⁵ The current version of the PAPPG (V4) is available at www.fema.gov/media-library/assets/documents/111781.

B. Provide additional guidance for reporting road flood water inundation damage and outline the required documentation to support claimed damage.

REQUIREMENTS

A. APPLICABILITY

Outcome: To establish the parameters of this policy and ensure it is implemented consistent with program authorities.

1. Recipients and Subrecipients.

This guidance is applicable to Recipients and Subrecipients that are legally responsible for the maintenance and restoration of public roads damaged by a Federally-declared major disaster.

2. Public Roads.

This guidance is only applicable to public roads as defined in the **Definitions** section at the end of this policy. Private roads, including homeowners association roads, are not eligible.⁶ Some private non-profit Applicants may have eligible roads and sidewalks, such as on a school campus; in those cases, their roads are subject to this policy.

B. GENERAL WORK ELIGIBILITY

Outcome: To define the overarching framework for eligible work related to inundated and submerged roads. All other PA eligibility requirements apply.⁷

1. Roads with Visible Damage.

Work to repair roads that have experienced surface damage, including flood water inundation damage identified once flood waters have receded, that is visible and quantifiable during inspection and directly attributed to the declared major disaster event is eligible for PA funding.

Examples of major visible and quantifiable surface damage caused by the declared major disaster event include collapses and slips. Minor surface damage to roads caused by the declared major disaster event is often similar to damage that may occur over time from other causes such as the age of the road, traffic flow, and frequent rain. Distinguishing between pre-existing damage and minor damage caused by the declared major disaster event is covered in **Section D.2. Maintenance Records Requirement** of this policy.

Distress evident on the surface such as potholes or fatigue cracking is generally ineligible for repair as this type of damage is rarely caused directly by one incident.⁸

⁶ See *Chapter 8:IX.A. Roads and Bridges (Category C)* of the PAPPG (V4).

⁷ See Title 44 of the Code of Federal Regulations (44 CFR) Part 206, Subpart H; and PAPPG (V4).

⁸ See *Chapter 8:IX.A. Roads and Bridges (Category C)* of the PAPPG (V4).

78 Restoration of sections of road with disaster-related surface damage will follow PA
79 guidance for work performed under Category C: Roads and Bridges.⁹
80

81 **2. Roads without Visible Damage.**

82 a. Submerged Roads without Visible Surface Damage.

83 Restoration work for roads that have experienced inundation by flood waters as a direct
84 result of a major disaster event where surface damage is not visible and quantifiable
85 during an inspection of the claimed section(s) of road after the flood waters have
86 receded is not eligible for PA Program funding. Claims of subsurface damage based on
87 the findings of an inspection¹⁰ for sections of road without visible and quantifiable
88 surface damage will not be considered for assistance from the PA Program.

89 Accordingly, costs associated with methods of inspection on sections of road without
90 visible and quantifiable surface damage are not eligible for PA reimbursement.
91

92 b. Projected Loss of Useful Service Life.

93 Restoration work based on a projected loss of useful service life (i.e., the potential
94 reduction in the road's remaining service life) is ineligible because it is not damage
95 caused by the major disaster event. Loss of useful service life is based on aging and
96 use of the roadway.¹¹ For example, if an Applicant is claiming subsurface deterioration
97 of a section of road that has experienced inundation based on the findings of an
98 inspection, this alone does not constitute disaster-related damage eligible for PA
99 funding since such deterioration is not caused by a single incident, but is the result of
100 the use of the road and normal weather conditions over time.
101

102 **3. Traffic-Induced Surface Damage Resulting from Reopening Road Prematurely.**

103 To help avoid damage to roads that have been inundated, Applicants should allow time for
104 saturated soil to dry out prior to reopening roads to normal traffic to prevent surface
105 damage from reopening roads prematurely. Such damage is traffic-induced, not disaster-
106 related, and should be expected on a saturated roadbed. Surface damage from reopening
107 roads to normal traffic prematurely may constitute negligence and, therefore, may not
108 eligible for repair assistance from PA.¹² Exceptions include surface damage caused by
109 emergency vehicles performing eligible debris removal or other emergency work,¹³ or
110 single-access roads that were required to be reopened due to lack of detour/alternate
111 routes. In such cases, the Applicant must provide documentation to justify reopening the
112 road prematurely as described in **Section E. Documentation to Support Claimed**
113 **Damage** of this policy.
114

⁹ Id.

¹⁰ Including destructive and non-destructive methods of inspection such as Ground-Penetrating Radar, Core Sampling, Soil Boring, and Falling Weight Deflectometers.

¹¹ See *Chapter 6:XXI.B. Loss of Useful Service Life* of the PAPPG (V4).

¹² See 44 CFR §206.223(e).

¹³ See *Chapter 7:III. Damage Caused During Performance of Emergency Work* of the PAPPG (V4).

115 **4. Basin Flooding.**¹⁴

116 In designated basin areas, basin flooding can result in roads that remain submerged
117 indefinitely. In such cases, waiting until flood waters recede to safely and effectively assess
118 potential damage, and any subsequent time extensions required, may not be feasible. PA
119 funding may be used to raise the grades of eligible sections of road faced with long-term
120 loss of use due to an unprecedented rise in basin water level when basin flooding is directly
121 attributed to the declared major disaster event.

122
123 Permanent work, including grade raises, related to basin flooding is only eligible if the
124 Applicant can demonstrate all of the following:

- 125 • The submerged section of road is in a designated basin area;
- 126 • The basin flooding is directly attributed to the declared major disaster event and does
127 not represent the culmination of multiple meteorological events that have caused
128 excessive run-off into the basin over an extended period of time; and
- 129 • The basin flooding results in long-term loss of use of critical routes.

130
131 PA funding will generally be limited to grade raises of highways and bridges of critical
132 routes projected to experience long-term loss of use due to basin flooding, as
133 demonstrated by the Applicant. Only those routes that are critical to restoring traffic service
134 are eligible for grade raises. Factors to evaluate whether individual routes are critical
135 include functional classification; provision of essential community services such as access
136 for emergency response, schools, and mail/delivery vehicles; and availability of alternate
137 routes and/or length of detours. FEMA, in coordination with the Recipient and Applicant, will
138 determine if the claimed roadway is a critical route and eligible for grade raises. It is not the
139 intent of the PA program to raise the grades in dips or other low spots along roadways that
140 suffer inundation from chronic flooding problems.

141
142 **5. Gravel Roads.**

143 Additional considerations specific to submerged gravel roads are as follows:

- 144 a. Gravel surface loss from inundation is not assumed and cannot be based on projected
145 or estimated loss. The Applicant must be able to demonstrate actual gravel surface
146 loss. If the applicant chooses to lay gravel on a longer section of the road, FEMA only
147 pays for the portion of the road that was disaster damaged. Gravel laid on non-disaster
148 damaged sections of the road are not eligible.
- 149 b. Rutting of submerged sections of gravel roads reopened to normal traffic flow
150 prematurely is typically not eligible. Rutting is a traffic-induced damage and is to be
151 expected on a saturated roadbed. Exceptions include rutting caused by emergency
152 vehicles performing eligible debris removal or other emergency work or single-access
153 roads that were required to be reopened due to lack of detour/alternate routes. In such
154 cases, the Applicant must provide documentation to justify reopening the road
155 prematurely as described in **Section E. Documentation to Support Claimed Damage**
156 of this policy.

¹⁴ See also *Chapter II:B.6.b. Basin Flooding* of the FHWA Emergency Relief Manual.

- c. Corrugation of gravel roads is not eligible for repair or restoration. Corrugation (or “washboarding”) is associated with traffic in dry conditions and not attributable to inundation.

C. TIMEFRAMES FOR REPORTING DAMAGE

Outcome: This section provides timelines for reporting damage associated with sections of road inundated by flood waters as a direct result of the declared event.

1. Deadline for Reporting Disaster-Related Damage.

Road surface damage resulting from inundation as a direct result of a major disaster must be identified and reported to FEMA within 60 days of the Recovery Scoping Meeting (RSM).¹⁵ The deadline for reporting disaster damage is applicable to all major disasters including those declared prior to the publication of this policy. Inundated and submerged roads should not be assessed until flood waters have receded to ensure the safety of damage assessment staff and to allow time for saturated soil to dry out. Allowing adequate time for saturated soil to dry out is necessary to effectively determine if damage has occurred.

2. Road Inundation Beyond the Deadline for Reporting Disaster-Related Damage.

In some cases, roads may remain submerged beyond the deadline for reporting disaster-related damage. In such cases, FEMA may extend the deadline for identifying and reporting damage if the Recipient submits a request in writing with justification for the extension based on extenuating circumstances beyond the Recipient’s or Subrecipient’s control.¹⁶ For example, if a site is inaccessible, as in the case of submerged roads, FEMA may extend the deadline for those sections of road until such time as the sites can safely be accessed for inspection.

Roadways that experience inundation from basin flooding may be submerged indefinitely. In such cases, impacted sections of road may be eligible for grade raises to address the prolonged inundation and loss of use as described in **Section B.4. Basin Flooding** of this policy.

D. DEMONSTRATING DISASTER-RELATED DAMAGE

Outcome: Applicants must demonstrate that surface damage to roadways was caused directly by the declared event.

1. Surface Damage as a Direct Result of Disaster-Related Flood Water Inundation.

Visible surface damage to roads caused by flood water inundation may become apparent once flood waters have receded. Voids may result from soil erosion, which can cause a collapse or slip along sections of submerged roads. Therefore, it is important to assess

¹⁵ See 44 CFR § 206.202(d)(ii) and *Chapter 5:I. List of Impacts* of the PAPPG (V4).

¹⁶ See 44 CFR § 206.202(f)(2) and *Chapter 5:I. List of Impacts* of the PAPPG (V4).

submerged roads *after* flood waters have receded to determine if the inundation from the declared event resulted in visible and quantifiable surface damage.

The Applicant must substantiate claimed surface damage with supporting documentation consistent with **Section E. Documentation to Support Claimed Damage** of this policy. FEMA will not accept a damage report simply based on a claim that a section of road has experienced inundation or based on documentation that indicates inundation has occurred without demonstrating any resulting surface damage. Similarly, there should be no presumption of eligible disaster-related damage to an inundated or submerged road for inclusion of the estimated repair costs in a joint preliminary damage assessment.

2. Maintenance Records Requirement.

When evaluating eligibility of reported road damage, including how the incident caused the damage, FEMA reviews maintenance records or other documentation establishing that the Applicant has a routine maintenance program. In the absence of maintenance records, FEMA will review whatever documentation is available to assist in making an informed decision on the condition of the road at the time the disaster occurred.

FEMA does not provide PA funding for repair of damage caused by deterioration, deferred maintenance, the Applicant’s failure to take measures to protect a facility from further damage, or negligence.¹⁷ Normal maintenance, such as work to repair potholes or fatigue cracking, is generally ineligible as this type of damage is rarely caused directly by one incident.¹⁸

E. DOCUMENTATION TO SUPPORT CLAIMED DAMAGE

Outcome: This section provides documentation to support claimed surface damage to roads due to inundation by flood waters as a direct result of the declared event.

1. Minimum Documentation to Support Claimed Damage.

- a. Pre- and post-event photos or videos of impacted sections of road, or other documentation to indicate pre- and post-event surface condition;
- b. Maintenance records including, if applicable, documentation of a pavement evaluation program or pavement management system (e.g., a regular documented pavement inspection using standards found in Distress Identification Manual for the Long-Term Pavement Performance Program (June 2003, FHWA-RD-03-031)); and
- c. Documentation of any repairs following pre-disaster assessments, specific to each section of road claimed and/or documentation of any post-disaster repair work already completed, specific to each section of road claimed.

¹⁷ See 44 CFR §206.223(e) and *Chapter 4:I.B.1. Result of Declared Incident* of the PAPPG (V4).

¹⁸ See *Chapter 8:IX.A. Roads and Bridges (Category C)* of the PAPPG (V4).

238 **2. Traffic-Induced Surface Damage Resulting from Reopening Road Prematurely.**

- 239 a. An explanation/justification for reopening the road prior to allowing saturated soil to dry
240 (e.g., emergency response, the performance of eligible emergency work, emergency
241 access, etc.).
- 242 b. For emergency response traffic, documentation of emergency call logs and a map
243 showing the route taken by the emergency vehicle(s).
- 244 c. If claiming surface damage from normal traffic loads due to reopening a single-access
245 road immediately following the declared event or once flood waters have receded,
246 documentation to support that no detour or alternate route was available and the road
247 was required to reopen for emergency access.

248

249 **3. Basin Flooding.**

- 250 a. Information to support the basin flooding was directly attributed to the declared major
251 disaster event and the long-term loss of use of critical routes.
- 252 b. For basin flooding as a direct result of the declared major disaster event: Information
253 showing that the water elevation in the basin has reached historically high levels; that
254 the rise in the water level occurred during the designated incident period; historic water
255 level elevation and rainfall intensity records; and/or maintenance reports or other
256 information that provides some historical perspective on events and water levels within
257 the basin.
- 258 c. For long-term loss of use of critical routes: Information demonstrating the length of time
259 the roadway has been closed to traffic and is projected to remain closed to traffic based
260 on the basin water level elevations that occurred as a direct result of the declared major
261 disaster event.

262

263 **4. Gravel Roads – Gravel Loss.**

- 264 a. Documentation indicating gravel loss directly attributed to the declared event (e.g., work
265 logs and material invoices quantifying the amount of aggregate placed in the damaged
266 section within 12 months of the start of the incident period).
- 267 b. Photos or video of the field of displaced gravel.

268

269 **5. Gravel Roads – Rutting.**

- 270 a. For emergency response traffic, documentation of emergency call logs and a map
271 showing the route taken by the emergency vehicle(s).
- 272 b. If claiming rutting from normal traffic loads due to reopening a single-access road
273 immediately following the declared event or once flood waters have receded,
274 documentation such as a work log indicating that the rutted section of road was graded
275 and surface aggregate applied prior to the event.

DEFINITIONS

To establish consistent terminology for purposes of implementing this policy, the following definitions are provided below. These definitions are specific to this policy and may differ from definitions prescribed for the same or similar terms in other policies.

A **Public Road** is any publicly-owned non-federal aid street, road, or highway for which an eligible Applicant has legal responsibility. Federal-aid routes are not eligible for Stafford Act permanent work under the PA Program. Bureau of Indian Affairs (BIA) roads may be eligible provided the Tribal Government does not receive funding from BIA or FHWA for the same work.

A **Federal-Aid Route** includes highways on the federal-aid highway program and all other public roads under the authority of FHWA not classified as local roads or rural minor collectors.

Disaster Damage means damage directly caused by a major disaster declared by the President under the Stafford Act within a designated disaster area.

Projected Loss of Useful Service Life means the claimed reduction of the remaining service life of a facility due to impacts caused by a major disaster declared under the Stafford Act. Claims for projected loss of useful service life typically involve non-visible disaster damage claims.

329 **Submerged or Inundated Road** means a section of road that is covered by flood waters for any
330 period of time. For purposes of this policy, the inundation must have occurred as a direct result of
331 a federally-declared major disaster.
332

333 A **Void** is an area under concrete or other paved surface, within the subsurface, caused by eroded
334 ground support created by soil erosion over time. Voids may contribute to visible and quantifiable
335 surface damages that may or may not be disaster related.
336

337 A **Collapse** can occur on a section of road that experiences a void due to soil erosion, making the
338 collapsed section of road incapable of supporting traffic and requiring repair or replacement of the
339 collapsed section(s).
340

341 A **Slip** occurs when soil erosion causes part of or all of a section of road to collapse and slide
342 downhill when located in elevated areas.
343

344 A **Basin** is a large depression in the land with no natural drainage outlet such that the water level
345 decreases only due to infiltration or evaporation.
346

347 **Corrugation**, or “**Washboarding**,” comprises a series of ripples which occur with the passage of
348 wheels rolling over unpaved roads at speeds sufficient to cause bouncing of the wheel on the
349 initially unrippled surface.
350

351 **MONITORING AND EVALUATION**

352 FEMA will closely monitor the implementation of this policy through close coordination with
353 regional and field staff, as appropriate, as well as FHWA and SLTT stakeholders.
354

355 **QUESTIONS**

356 Direct questions to FEMA-Recovery-PA-Policy@fema.dhs.gov.
