

Wilkes-Barre–Hanover Levee System Information for Property Owners

LOCATION:
Hanover Township
and City of Wilkes-Barre
Luzerne County
Pennsylvania

A Note about Flood Risk and Flood Insurance

Levees are designed to provide a specific level of protection. They can be overtopped or fail during flood events larger than those for which the levee was designed. Levees also decay over time, which may increase the likelihood of failure. They require regular maintenance and periodic upgrades to retain their level of protection. When levees fail, the resulting damage, including loss of life, may be much greater than if the levee system had not been built.

For all these reasons, the Federal Emergency Management Agency (FEMA) strongly encourages people in leveed areas to understand their flood risk; know and follow evacuation procedures; and protect their properties by purchasing flood insurance, floodproofing their structures, or taking other precautionary measures. For more information on flood insurance, please visit FloodSmart.gov.

What is a levee?

The National Flood Insurance Program (NFIP) defines a levee in Title 44, Chapter 1, Section 59.1 of the Code of Federal Regulations (44 CFR 59.1) as “a man-made structure, usually an earthen embankment, designed and constructed in accordance with sound engineering practices to contain, control, or divert the flow of water in order to reduce risk from temporary flooding.” The NFIP regulations define a levee system as “a flood protection system which consists of a levee, or levees, and associated structures, such as closure and drainage devices, which are constructed and operated in accordance with sound engineering practices.”

RISK MAPPING, ASSESSMENT, AND PLANNING PROGRAM (RISK MAP)

The Federal Emergency Management Agency’s Risk MAP Program delivers quality data that increases public awareness and leads to action to reduce risk to life and property. Risk MAP is a nationwide program that works in collaboration with States, Tribes, and Local communities using best available science, rigorously vetted standards, and expert analysis to identify risk and promote mitigation action, resulting in safer, more resilient communities.

FLOOD MAPPING

One of FEMA's top priorities is to ensure that people living and working in levee-impacted areas are aware of their flood risk. FEMA uses the process of levee accreditation to provide credible flood hazard information in these areas.

For a levee system to be mapped as reducing the flood hazard from the 1-percent-annual-chance flood, it must be accredited. For a levee system to be accredited, the community must demonstrate that it continues to meet the Federal requirements to show that it is tall enough, strong enough, and properly operated and maintained.

The current flood map for Luzerne County, dated November 2, 2012, shows the **Wilkes-Barre—Hanover Levee System** as reducing flood hazards. FEMA has found, however, that the community has not provided the data and documentation needed to accredit these levee systems. FEMA is working with a Local Levee Partnership Team to perform additional analyses and gather the data needed to update the levee-impacted areas.

FEMA is also working with the communities in Luzerne County on a long-term process of updating the flood maps along the Susquehanna River. This map update will maintain the flood risk zones shown on the current maps in the areas impacted by the **Wilkes-Barre—Hanover Levee System**. The maps will have a note explaining that these flood hazards will be updated later.

*All estimates are approximate and are based on the levee impact area shown in the National Levee Database (NLD).

**Critical facilities include EMS, fire, and police stations, schools, and hospitals.
