1 Introduction and Background

Beginning in the early 1990s, the Federal Insurance and Mitigation Administration of FEMA has issued 11 Technical Bulletins that provide guidance on interpreting, enforcing, and complying with the minimum building performance requirements in the National Flood Insurance Program (NFIP) regulations (Title 44 of the Code of Federal Regulations [CFR] Parts 59 and 60). These requirements are intended to reduce the loss of life and property as well as the economic and social hardships that can result from flooding.

The NFIP is a federal program established by the National Flood Insurance Act of 1968, as amended (42 U.S. Code §§ 4011 et seq.). The primary purposes of the Act are to:

- Better indemnify individuals for flood losses through insurance
- Reduce future flood damage through state and community floodplain management regulations
- Reduce federal expenditures for disaster assistance and flood control

To participate in the NFIP, communities must adopt and enforce floodplain management regulations that meet or exceed NFIP floodplain management requirements. Owners of property located in communities that participate can purchase NFIP flood insurance as a protection against the financial impact of flood losses.

NFIP REQUIREMENTS AND HIGHER REGULATORY STANDARDS

State or Local Requirements. State or local requirements that are more restrictive or stringent than the minimum requirements of the NFIP take precedence. The Technical Bulletins and other FEMA publications provide guidance on the minimum requirements of the NFIP and describe best practices. Design professionals, builders, and property owners should contact local officials to determine whether more restrictive provisions apply to buildings or sites in question. All other applicable requirements of the state or local building codes must also be met.

Substantial Improvement and Substantial Damage. As part of issuing permits, local officials must review not only proposals for new construction but also for work on existing buildings to determine whether the work constitutes Substantial Improvement or repair of Substantial Damage. If the work is determined to constitute Substantial Improvement or repair of Substantial Damage, the buildings must be brought into compliance with the NFIP requirements for new construction. Some communities modify the definitions of Substantial Improvement and/or Substantial Damage to be more restrictive than the NFIP minimum requirements. For more information on Substantial Improvement and Substantial Damage, see FEMA P-758, Substantial Improvement/Substantial Damage Desk Reference (2010), and FEMA 213, Answers to Questions About Substantially Improved/Substantially Damaged Buildings (2018).

Higher Building Elevation Requirements. Some states and communities require that buildings be elevated or dry floodproofed (non-residential in Zone A only) above the NFIP minimum requirement. The additional elevation is called freeboard. Design professionals, builders, and property owners should check with local officials to determine whether a state or community has freeboard requirements. References to building elevations in this Technical Bulletin should be construed as references to the community’s elevation requirement in areas where freeboard is required.
The NFIP floodplain management regulations, codified in Title 44 of the Code of Federal Regulations (CFR) Part 60, specifically 44 CFR § 60.3, include minimum building performance criteria that apply to (1) new construction, (2) work determined to be Substantial Improvement such as improvements, alterations, and additions, and (3) the repair of buildings determined to have incurred Substantial Damage and that are in Special Flood Hazard Areas (SFHAs).

1.1 Intended Audience

The Technical Bulletins are intended for use primarily by state and local officials who are responsible for interpreting and enforcing the NFIP floodplain management regulations.

The Technical Bulletins may also be used by design professionals (e.g., architects, engineers), contractors, building owners and operators, planners, and other interested stakeholders to help understand and comply with NFIP floodplain management requirements. Using the information in the Technical Bulletins will improve the design and construction of buildings, including their utility systems, that are in flood prone areas, thereby reducing the potential for damage and increasing building and community resilience.

1.2 Purpose of Technical Bulletins

The Technical Bulletins provide specific FEMA guidance for state and local floodplain management officials on complying with the NFIP’s minimum floodplain management criteria. While the primary focus of the Technical Bulletins is on how to meet the minimum NFIP floodplain management requirements, they also include information on:

- Recommended best practices for reducing flood losses
- Considerations related to NFIP flood insurance rates
- Building codes and standards

Additional information on how to use the Technical Bulletins is provided in Section 2.

1.3 Synopses of Technical Bulletins (as of January 2021)

<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>3</td>
<td>Requirements for the Design and Certification of Dry Floodproofed Non-Residential and Mixed-Use Buildings Located in Special Flood Hazard Areas (2021)</td>
<td>Guidance on the NFIP requirements for the design and certification of dry floodproofing systems for new and substantially improved non-residential and mixed-use buildings with lowest floors below the BFE in Zones A, AE, A1-30, AR, AO, and AH. The guidance can also be used as a best practice for improving the flood resilience of existing buildings that are not substantially improved. New in the 2020 edition are appendices with guidance for completing FEMA Form 086-0-34, NFIP Floodproofing Certificate for Non-Residential Structures, and an example calculation for estimating total seepage. FEMA Form 086-0-34 is used to satisfy the requirement for design professionals to certify designs and as-built drawings and inspection and is a requirement for an NFIP flood insurance policy. The total seepage estimation is used to determine if dry floodproofing measures are considered substantially impermeable to floodwaters.</td>

### 1.4 Organization of Technical Bulletin 0 – User’s Guide to Technical Bulletins

This User’s Guide to Technical Bulletins contains:

- Information on how to use the Technical Bulletins
- Crosswalk of the NFIP regulations and the Technical Bulletins
- Key concepts and requirements in the Technical Bulletins
- Glossary of acronyms and key terms
- How to obtain copies of Technical Bulletins and submit comments
- FEMA Headquarters and Regional office contact information
- Index of key words and subjects in the Technical Bulletins
- References and resources

### 2 How to Use the Technical Bulletins

FEMA revises or develops new Technical Bulletins as needed to provide guidance to state and local officials, design professionals, contractors, building owners and operators, planners, and other interested stakeholders to help them comply with NFIP floodplain management requirements.
The Technical Bulletins are focused on minimum NFIP floodplain management criteria. They also provide guidance on best practices for floodplain management and flood hazard-resistant construction, building codes and standards, and NFIP flood insurance considerations.

## 2.1 Minimum NFIP Floodplain Management Criteria

To participate in the National Flood Insurance Program, communities must adopt regulations that meet or exceed the minimum requirements in 44 CFR § 60.3. The Technical Bulletins provide specific FEMA guidance on complying with minimum NFIP floodplain management requirements. If a community chooses not to use the methods or implement the measures that are described in the Technical Bulletins, the community must demonstrate how it is meeting the requirements of 44 CFR § 60.3.

In addition to the community’s responsibility to ensure specific building requirements are met, such as elevating or dry floodproofing buildings, elevating or otherwise protecting utilities, and installing openings in enclosure walls, communities are also required to review development proposals “to determine whether such proposals will be reasonably safe from flooding” (44 CFR § 60.3(a)(4)).

To participate in the NFIP, all communities must adopt a resolution or ordinance that expresses a “commitment to recognize and evaluate flood hazards in all official actions and to take such other official action as reasonably necessary to carry out the objectives of the program” (44 CFR § 59.22(a)(8)). This is in addition to the general requirement that communities “take into account flood hazards to the extent that they are known in all official actions relating to land management and use” (44 CFR § 60.1(c)).

## 2.2 Best Practices

Some of the best practices for floodplain management and flood hazard-resistant construction that are described in the Technical Bulletins are recommendations for increasing hazard resistance in buildings and their utility systems and for reducing the loss of life and property and economic and social hardships.

FEMA strongly encourages that these best practices be:

- Incorporated into state or community floodplain management ordinances or building codes

---

### MINIMUM FLOODPLAIN MANAGEMENT CRITERIA

The guidance in the Technical Bulletins represents established, application methodologies for minimum NFIP floodplain management criteria.

### REASONABLY SAFE FROM FLOODING

The Technical Bulletins can be used by communities to help them evaluate whether proposed development will be reasonably safe from flooding.

### COMMUNITY COMMITMENT TO REDUCING FLOOD LOSSES

Using the guidance in the Technical Bulletins illustrates a community’s commitment towards evaluating and addressing flood hazards.

### USE OF SHALL OR MUST

“Shall” or “must” in the Technical Bulletins indicates official guidance on methods or measures required for compliance with 44 CFR § 60.3. Descriptions of other measures, such as best practices, do not use “shall” or “must.” FEMA strongly encourages that best practice measures be considered.
• Implemented by designers, builders, or other stakeholders to reduce risk and improve resilience
• Used to potentially lower NFIP flood insurance premiums

Many of these best practices are based on field-verified data including data from decades of post-disaster building performance assessments.

EXAMPLE OF A BEST PRACTICE FROM TECHNICAL BULLETIN 2, FLOOD DAMAGE-RESISTANT MATERIALS REQUIREMENTS

If the lowest floor of a building is elevated higher than the BFE, which is common when the owner wants a full story of elevation to accommodate parking under the building, FEMA recommends that flood damage-resistant materials also be used up to the level of the lowest floor to reduce damage in these areas should flooding exceed the BFE.

2.3 Building Codes and Standards

In addition to complying with the NFIP requirements, all new construction, Substantial Improvements, and repair of Substantial Damage must comply with the applicable building codes and standards that have been adopted and that are enforced by states and communities. Building codes govern the design, construction, alteration, and maintenance of structures. They specify the minimum requirements to adequately safeguard the health, safety, and welfare of building occupants. Rather than create and maintain their own building codes, most states and local jurisdictions adopt the International Codes® (I-Codes®), which are a family of model building codes published by the International Code Council® (ICC®).

I-Codes include the International Residential Code® (IRC®), International Building Code® (IBC®), International Existing Building Code® (IEBC®), and codes that govern the installation of mechanical, plumbing, fuel gas service, and other aspects of building construction. Provisions in state- and community-adopted building codes can vary from these model codes, so coordination with local building officials is necessary to confirm which requirements apply within a given jurisdiction.

The IBC applies to all applicable buildings and structures whereas the scope of the IRC is limited to one- and two-family dwellings and townhomes not more than three stories above grade plane. The IBC can be used to design dwellings, but it is used primarily for buildings and structures other than dwellings within the IRC scope. The flood provisions in the IBC are included by reference to ASCE 24, Flood Resistant Design and Construction, a standard developed by the American Society of Civil Engineers (ASCE).

FEMA has deemed that the latest published editions of the I-Codes generally meet or exceed NFIP requirements for buildings and structures. Excerpts of the flood provisions of the I-Codes are available on FEMA’s

The joint ICC and FEMA publication Reducing Flood Losses Through the International Codes: Coordinating Building Codes and Floodplain Management Regulations, 5th Edition (2019) recommends that communities coordinate the administration of floodplain management provisions and building codes. Differences in requirements between the regulatory tools can lead to inconsistencies or confusion when administering and enforcing requirements for development in flood-prone areas.

### 2.4 NFIP Flood Insurance Considerations

Each Technical Bulletin addresses NFIP flood insurance considerations related to the topic of the Technical Bulletin. The following stakeholders should be aware of these considerations:

- Local officials, designers, builders, and other stakeholders
- Property owners who are concerned about the impact of design and construction decisions on their NFIP flood insurance premiums

NFIP flood insurance premiums are based on factors that include, but are not limited to, flood risk zone, elevation of the lowest floor above or below the BFE, type of building and foundation, the number of floors, and whether there is a basement or enclosure below the elevated building.

The Technical Bulletins address situations in which a compliant building might still be subject to higher NFIP flood insurance premiums. As only one example, NFIP Technical Bulletin 3, Requirements for the Design and Certification of Dry Floodproofed Non-Residential and Mixed-Use Buildings Located in Special Flood Hazard Areas, notes that the minimum NFIP requirements allow a new or Substantially Improved non-residential building in Zone A to have a lowest floor below the base flood elevation (BFE), provided that the building has been designed, constructed, and certified to be floodproofed to the BFE and meets established criteria. However, the NFIP flood insurance rating procedures provide credit for dry floodproofing only if the dry floodproofing measures are certified to be at least 1 foot above the BFE, even if that level of protection is not required by local floodplain management regulations.

### 3 Crosswalk of NFIP Regulations and Technical Bulletins

Table 2 is a crosswalk of select NFIP regulations and the Technical Bulletins that provide guidance on them. The table is intended to be a general guide to the Technical Bulletins; it does not include all of the NFIP regulations. See the index in Section 7 for more information on where to find guidance in the Technical Bulletins on specific NFIP regulations.
Table 2: Crosswalk of NFIP Regulations, Technical Bulletins, and Key Concepts

</tr>
</thead>
<tbody>
<tr>
<td><strong>44 CFR § 60.3(c)(3)</strong> Require that all new construction and substantial improvements of non-residential structures within Zones A1-30, AE, and AH zones on the community’s FIRM (i) have the lowest floor (including basement) elevated to or above the base flood level, or (ii) together with attendant utility and sanitary facilities, be designed so that below the base flood level the structure is watertight with walls substantially impermeable to the passage of water and with structural components having the capability of resisting hydrostatic and hydrodynamic loads and effects of buoyancy.</td>
<td>Technical Bulletin 3  <strong>Requirements for the Design and Certification of Dry Floodproofed Non-Residential and Mixed-Use Buildings Located in Special Flood Hazard Areas</strong>  Numerous planning and engineering design considerations factor into whether dry floodproofing systems are viable options. Dry floodproofing features include flood shields for openings (doors, windows, louvers), walls and floors that are substantially impermeable and adequately reinforced to withstand floodwater pressures and impact forces generated by floating debris, use of membranes and sealants, installation of pumps, and utility protection.</td>
<td></td>
</tr>
<tr>
<td><strong>44 CFR § 60.3(c)(4)</strong> Provide that where a non-residential structure is intended to be made watertight below the base flood level, (i) a registered professional engineer or architect shall develop and/or review structural design, specifications, and plans for the construction, and shall certify that the design and methods of construction are in accordance with the accepted standards of practice for meeting the applicable provisions of paragraphs (c)(3)(i) or (c)(8)(ii) of this section, and (ii) a record of such certificates which includes the specific elevation (in relation to mean sea level) to which such structures are floodproofed shall be maintained with the official designated by the community.</td>
<td>Technical Bulletin 6  <strong>Requirements for Dry Floodproofed Below-Grade Parking Areas Under Non-Residential and Mixed-Use Buildings Located in Special Flood Hazard Areas</strong>  Below-grade parking areas are permitted beneath non-residential and mixed-use buildings in Zone A if buildings and below-grade parking areas are dry floodproofed (watertight and substantially impermeable).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Technical Bulletin 10  <strong>Ensuring That Structures Built on Fill In or Near Special Flood Hazard Areas Are Reasonably Safe From Flooding</strong>  The requirement that the lowest floor, including a basement, of new and Substantially Improved non-residential buildings in Zone A be at or above the BFE may be met by elevating buildings on compacted earthen fill material.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Technical Bulletin 11  <strong>Crawlspace Construction for Buildings Located in Special Flood Hazard Areas</strong>  Although technically basements, below-grade crawlspaces are permitted if communities modify local regulations to explicitly allow below-grade crawlspaces with specific limitations including, but not limited to, flood velocities, perimeter wall height, and depth below grade.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Technical Bulletin 3  <strong>Requirements for the Design and Certification of Dry Floodproofed Non-Residential and Mixed-Use Buildings Located in Special Flood Hazard Areas</strong>  FEMA Form 086-0-34, NFIP Floodproofing Certificate for Non-Residential Structures provides information necessary for insurance underwriters to rate dry floodproofed buildings. The same form should be used to satisfy the requirement that design professionals certify designs and as-built drawings and inspection. The certificate contains information on the building, certification of the elevation to which the building is floodproofed, and certification by the design professional that the building has been designed and constructed to the accepted standard of practice (ASCE 24-05, ASCE 24-14, or their equivalent).</td>

<tbody>
<tr>
<td><strong>44 CFR § 60.3(c)(5)</strong>&lt;br&gt;Require, for all new construction and substantial improvements, that fully enclosed areas below the lowest floor that are usable solely for parking of vehicles, building access or storage in an area other than a basement and which are subject to flooding shall be designed to automatically equalize hydrostatic flood forces on exterior walls by allowing for the entry and exit of floodwaters. Designs for meeting this requirement must either be certified by a registered professional engineer or architect or meet or exceed the following minimum criteria: A minimum of two openings having a total net area of not less than one square inch for every square foot of enclosed area subject to flooding shall be provided. The bottom of all openings shall be no higher than one foot above grade. Openings may be equipped with screens, louvers, valves, or other coverings or devices provided that they permit the automatic entry and exit of floodwaters.</td>
<td>Technical Bulletin 1&lt;br&gt;Requirements for Flood Openings in Foundation Walls and Walls of Enclosures Below Elevated Buildings in Special Flood Hazard Areas&lt;br&gt;Technical Bulletin 7&lt;br&gt;Wet Floodproofing Requirements for Structures Located in Special Flood Hazard Areas&lt;br&gt;Technical Bulletin 11&lt;br&gt;Crawlspace Construction for Buildings Located in Special Flood Hazard Areas</td>
<td>Flood openings in foundation walls and walls of enclosures relieve hydrostatic loads, helping to meet the basic performance requirement to prevent flotation, collapse, or lateral movement due to flood forces. Proper design, selection, and installation of flood openings help meet the basic performance requirement to automatically equalize hydrostatic flood forces on exterior walls and prevent flotation, collapse, or lateral movement due to flood forces. Measures known as “wet floodproofing” may be used for specific types of buildings, including detached garages, storage buildings, some agricultural buildings, and buildings that meet the definition for functionally dependent use. Wet floodproofing reduces hydrostatic loads on buildings by allowing floodwater to enter Crawlspace, including below-grade crawlspace, are treated as enclosures below elevated buildings. Below-grade crawlspace may be permitted if communities modify local regulations to explicitly allow below-grade crawlspace with specific limitations including, but not limited to, flood velocities, perimeter wall height, and depth below grade.</td>
</tr>
<tr>
<td><strong>Applies to Zone AO (in addition to requirements for Zone A)</strong></td>

<td>Technical Bulletin 8 Corrosion Protection for Metal Connectors and Fasteners in Coastal Areas</td>
<td>Where buildings are exposed to moisture and airborne salt, corrosion of light gauge metal connectors and fasteners contributes to the loss of load path. Corrosion protection for metal fasteners and connectors in buildings in coastal areas is important in helping to ensure that the buildings are adequately anchored to resist flotation, collapse, and lateral movement due to the combined effects of wind and water loads acting simultaneously on all building components.</td>
</tr>
</tbody>
</table>
44 CFR § 60.3(e)(5)
Provide that all new construction and substantial improvements within Zones V1-30, VE, and V on the community’s FIRM have the space below the lowest floor either free of obstruction or constructed with non-supporting breakaway walls, open wood lattice-work, or insect screening intended to collapse under wind and water loads without causing collapse, displacement, or other structural damage to the elevated portion of the building or supporting foundation system. For the purposes of this section, a breakaway wall shall have a design safe loading resistance of not less than 10 and no more than 20 pounds per square foot. Use of breakaway walls which exceed a design safe loading resistance of 20 pounds per square foot (either by design or when so required by local or State codes) may be permitted only if a registered professional engineer or architect certifies that the designs proposed meet the following conditions: (i) Breakaway wall collapse shall result from a water load less than that which would occur during the base flood; and (ii) The elevated portion of the building and supporting foundation system shall not be subject to collapse, displacement, or other structural damage due to the effects of wind and water loads acting simultaneously on all building components (structural and non-structural). Water loading values used shall be those associated with the base flood. Wind loading values used shall be those required by applicable State or local building standards.
Such enclosed space shall be useable solely for parking of vehicles, building access, or storage.

Obstructions that divert or obstruct the free flow of floodwater and waves below elevated buildings in Zone V could impose additional flood loads on foundation systems or adjacent buildings.
Free-of-obstruction requirements apply to: access stairs and ramps; attached and detached decks and porches; elevators; enclosed areas at or above grade; equipment and tanks; foundation bracing; grade beams; shear walls; concrete slabs; accessory storage structures; detached garages; erosion control structures; fences and privacy walls; fill; on-site septic systems; restroom buildings and comfort stations; and swimming pools and spas.

Walls designed to break away under flood loads help to prevent the walls from obstructing the floodwater and to minimize the transfer of flood and wave loads to the foundations of elevated buildings.

BFE = base flood elevation
CFR = Code of Federal Regulations
FEMA = Federal Emergency Management Agency
FIRM = Flood Insurance Rate Map
4 Key Concepts and Requirements for Structures

Users of the Technical Bulletins should have a basic understanding of the following key concepts:

- Special Flood Hazard Areas (SFHAs)
- Lowest floor, enclosure, and basement
- Substantial Improvement and Substantial Damage
- Open foundations in Zone V

These concepts underlie the requirements that are critical in determining compliance with minimum NFIP floodplain management criteria. Most of these concepts and other key terms used in NFIP regulations are defined in Sections 4 and 5.

4.1 Special Flood Hazard Areas

The SFHA is the land area subject to flooding by the base flood. SFHAs are shown on FIRMs prepared by FEMA as Zones A and V. The base flood is the flood that has a 1 percent chance of being equaled or exceeded in any given year (commonly called the “100 year flood”). FIRMs also show Zone X, which are areas outside the SFHA.

In communities that participate in the NFIP, the minimum floodplain management requirements govern development in SFHAs, including buildings and other structures, subdivisions, new and replacement water supply systems, and new and replacement sanitary sewage systems. Floodplain management requirements for buildings and other structures can differ depending on the flood zone in which a structure is located.

Figure 1 shows the typical flood zones from coastal and riverine flood sources. The criteria for construction in Zones V, VE, V1-30 and VO, which are collectively referred to as Zone V or Coastal High Hazard Areas, are generally more stringent than in Zones A, AE, A1–30, AR, AO, and AH, which are collectively referred to as Zone A. Zone A exists in both coastal and riverine flood source environments.

Zone A. In SFHAs identified as Zone A (Zones A, AE, A1-30, AR, AO, and AH), the principal source of flooding is runoff from rainfall, snowmelt, or coastal storms when the potential base flood wave height is less than 3.0 feet. Zone A has minimum requirements that specify the elevation of the lowest floor, including the basement, in relation to the BFE or depth of the base flood. Specific requirements apply to fully enclosed areas below the lowest floor.

Zone V. Zone V (Zones V, VE, V1-30, and VO), also called Coastal High Hazard Areas, extends from offshore to the inland limit of a primary frontal dune along an open coast, and any other area subject to high-velocity wave

NFIP DEFINITION OF DEVELOPMENT

“Any man-made change to improved or unimproved real estate, including but not limited to buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations, or storage of equipment or materials” (44 CFR § 59.1).
action from storms or tsunamis where the potential base flood wave height is 3.0 feet or more. Zone V has minimum requirements pertaining to the siting of buildings, elevation of the lowest horizontal structural member of the lowest floor in relation to the BFE, foundation design, enclosures below the lowest floor, and alterations of sand dunes and mangrove stands.

**Zone X.** Zone X identifies areas outside the SFHA. Zone X (shaded) identifies two areas of moderate flood hazard: (1) areas subject to inundation by the flood that has a 0.2 percent chance of being equaled or exceeded during any given year (commonly called the “500-year flood”) and (2) areas protected by accredited levee systems. Zone X (unshaded) identifies areas of minimal flood hazard, which are outside the 500-year floodplain. The NFIP floodplain management requirements do not apply in Zone X.

**Example of Criteria Difference.** An example of a difference in criteria for Zone A and Zone V is where the lowest floor is measured (see Figure 2):

- In Zone A, the lowest floor (including basement) of a structure must be elevated to or above the BFE.
- In Zone V, the bottom of the lowest horizontal structural member of the lowest floor of a structure (excluding pilings or columns) must be elevated to or above the BFE.

**COASTAL A ZONE**

Since 2009, coastal flood studies have examined wave conditions in Zone A. Based on the studies, FEMA delineates an informational line called the Limit of Moderate Wave Action (LiMWA) on FIRMs where wave heights in Zone A are expected to be 1.5 feet or greater during base flood conditions. See Figure 1.

FEMA uses the term “Coastal A Zone” to refer to areas seaward of the LiMWA and landward of the Zone V boundary or landward of the shoreline where Zone V is not identified. The term refers to some areas identified as Zone A that are subject to flooding from a coastal or tidal source. However, Coastal A Zones are not identified on FIRMs, and the NFIP regulations for development in SFHAs and the NFIP regulations that govern the identification of SFHAs on maps do not use the term “Coastal A Zone.”

The NFIP floodplain management requirements regulate areas identified as Coastal A Zones to Zone A standards. FEMA’s Community Rating System awards credits to communities that regulate Coastal A Zones to Zone V standards. The latest editions of the I-Codes and ASCE 24 require buildings in Coastal A Zones to meet Zone V requirements; FEMA guidance, best practices, and FEMA Mitigation Assessment Team reports support this requirement.
4.2 Lowest Floor, Enclosure, and Basement

Under the NFIP:

- The **lowest floor** is defined as “the lowest floor of the lowest enclosed area (including basement). An unfinished or flood resistant enclosure, usable solely for parking of vehicles, building access or storage in an area other than a basement area is not considered a building’s lowest floor; *Provided*, that such enclosure is not built so as to render the structure in violation of the applicable non-elevation design requirements of § 60.3” (44 CFR § 59.1).

- An **enclosure** is an area below an elevated building that is enclosed by walls on all sides.

- A **basement** is defined as “any area of the building having its floor subgrade (below ground level) on all sides” (44 CFR § 59.1).

4.3 Substantial Improvement and Substantial Damage

The repair or improvement of buildings presents an opportunity to reduce future flood damage to structures and to improve their resilience. Local floodplain management regulations based on the NFIP and building codes contain requirements that apply not only to new structures but also to buildings with proposed Substantial Improvements or repair of Substantial Damage (described below).

As part of issuing permits, local officials must review not only proposals for new construction but also for work on existing buildings to determine whether the work constitutes Substantial Improvement or repair of Substantial Damage. If the work is determined to constitute Substantial Improvement or repair of Substantial Damage, the buildings must be brought into compliance with the NFIP requirements for new construction, including the requirement that the lowest floor be elevated to or above the BFE. Meeting this requirement can also be accomplished by demolishing the building followed by constructing a new building that meets the NFIP requirements on the same site or by relocating the building to outside the SFHA. More information on Substantial Improvement and Substantial Damage can be found in FEMA P-758, *Substantial Improvement/Substantial Damage Desk Reference* (2010), and FEMA 213, *Answers to Questions About Substantially Improved/Substantially Damaged Buildings* (2018).
Substantial Improvement is defined in 44 CFR § 59.1 as:

… Any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the “start of construction” of the improvement. This term includes structures which have incurred “substantial damage,” regardless of the actual repair work performed. The term does not, however, include either:

1. Any project for improvement of a structure to correct existing violations of state or local health, sanitary, or safety code specifications which have been identified by the local code enforcement official and which are the minimum necessary to assure safe living conditions or

2. Any alteration of a “historic structure,” provided that the alteration will not preclude the structure’s designation as a “historic structure.”

Substantial Damage is defined in 44 CFR § 59.1 as “damage of any origin sustained by a structure whereby the cost of restoring the structure to its before-damaged condition would equal or exceed 50 percent of the market value of the structure before the damage occurred.” Substantial Damage can have any cause, not just flooding.

Some communities modify the definitions of Substantial Improvement and Substantial Damage requirements in one of two ways: (1) adopting a lower threshold than 50 percent (e.g., 40 percent, 30 percent) or (2) tracking costs of improvements and costs of repairs over a specific period, referred to as “cumulative Substantial Improvement.”

4.4 Open Foundations in Zone V

Coastal waves and flooding can exert strong hydrodynamic forces on any building element that is exposed to waves or the flow of water. Therefore, open foundation systems that offer minimal resistance to waves and floodwaters passing beneath elevated buildings (e.g., pile and column foundations) are required in Zone V.

The NFIP requires that all new construction and Substantially Improved buildings in Zone V be elevated to or above the BFE on open foundations (pilings, columns) that allow floodwater and waves to pass beneath the elevated structure. The NFIP further requires that areas below elevated structures remain free of obstructions that would prevent the free flow of coastal floodwater and waves during a base flood event. The NFIP considers shear walls acceptable in limited circumstances where lateral loads on upper stories of buildings cannot be adequately resisted by piling or column foundations.

COASTAL A ZONE WAVE HAZARD

Coastal A Zones are subject to conditions similar to those in Zone V (Coastal High Hazard Areas), including breaking waves, erosion, and scour.

Although the minimum NFIP requirements for Coastal A Zones are the same as Zone A, it is recommended that structures in Coastal A Zones be designed and constructed to Zone V standards.
# 5 Acronyms and Key Terms

The acronyms and key terms that are used in the Technical Bulletins are defined in Sections 5.1 and 5.2, respectively.

5.2 Glossary of Terms Used in Technical Bulletins

The quoted material from ASCE 24-14 in this glossary is used with permission.

Accessory structure: A structure on the same parcel of property as a principal structure, the use of which is incidental to the use of the principal structure. Detached garages used for parking of vehicles and limited storage and small sheds used for limited storage are considered accessory structures (see FEMA Policy #104-008-03 and FEMA Floodplain Management Bulletin P-2140, Floodplain Management Requirements for Agricultural Structures and Accessory Structures [2020]).

Active: Dry floodproofing measures or dry floodproofing system components that require human intervention or action before the onset of flooding to be effective (e.g., flood shields that must be installed valves that must be closed).

Area of special flood hazard: “Land in the flood plain within a community subject to a 1 percent or greater chance of flooding in any given year. The area may be designated as Zone A on the Flood Hazard Boundary Map (FHB). After detailed ratemaking has been completed in preparation for publication of the flood insurance rate map, Zone A usually is refined into Zones A, AO, AH, A1–30, AE, A99, AR, AR/A1–30, AR/AE, AR/AO, AR/AH, AR/A, VO, or V1–30, VE, or V. For purposes of these regulations, the term ‘special flood hazard area’ is synonymous in meaning with the phrase ‘area of special flood hazard’ ” (44 CFR § 59.1).

Ancillary area: Common area such as a lobby, foyer, office used by building management, exercise space, meeting room, and mail room (FEMA P-2037, Flood Mitigation Measures for Multi-Family Buildings [2019]).

Base flood: “Flood having a one percent chance of being equaled or exceeded in any given year” (44 CFR § 59.1).

Base flood elevation (BFE): The computed elevation to which floodwater is anticipated to rise during the base flood, including wave height, relative to the datum specified on the Flood Insurance Rate Map. The BFE is shown on the FIRM for Zones AE, AH, A1–30, AR, AR/A, AR/AE, AR/AO, AR/AH, AR/A, VO, or V1–30, VE, and VE. For Zones AR/AH and AR/AO, a depth of flooding is provided for the 1 percent annual chance event. SFHAs without BFEs are identified on FIRMs as Zone A or Zone V. When BFEs are not identified, communities must obtain, review and reasonably use any BFE data available from a federal, state, or other source.

Basement: “Area of the building having its floor subgrade (below ground level) on all sides” (44 CFR § 59.1). NFIP regulations do not allow basements to extend below the BFE except in dry-floodproofed, non-residential buildings.

Breakaway wall: “A wall that is not part of the structural support of the building and is intended through its design and construction to collapse under specific lateral loading forces without causing damage to the elevated portion of the building or supporting foundation system” (44 CFR § 59.1).

Coastal A Zone: “Area within a special flood hazard area, landward of a V Zone or landward of an open coast without mapped V Zones. In a Coastal A Zone, the principal source of flooding must be astronomical tides, storm surges, seiches, or tsunamis, not riverine flooding. During the base flood conditions, the potential for breaking wave heights shall be greater than or equal to 1.5 feet. The inland limit of the Coastal A Zone is (1) the Limit of Moderate Wave Action if delineated on a FIRM, or (2) designated by the authority having jurisdiction” (ASCE 24-14).
Coastal High Hazard Area: “An area of special flood hazard extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high velocity wave action from storms or seismic sources” (44 CFR § 59.1). The coastal high hazard area is shown on a FIRM or other flood hazard map as Zone V, VO, VE, or V1-30.

Community: “Any State or area or political subdivision thereof, or any Indian tribe or authorized tribal organization, or Alaska Native village or authorized native organization, which has authority to adopt and enforce floodplain management regulations for the areas within its jurisdiction” (44 CFR § 59.1).

Design flood: “The flood associated with the greater of the following two areas: (1) area within a floodplain subject to a 1% or greater chance of flooding in any year, or (2) area designated as a flood hazard area on a community’s flood hazard map or otherwise legally designated” (ASCE 24-14).

Design flood elevation (DFE): “Elevation of the design flood, including wave height, relative to the datum specified on the community’s flood hazard map” (ASCE 24-14). In areas designated as Zone AO, the design flood elevation is the elevation of the highest existing grade of the building's perimeter plus the depth number (in feet) specified on the flood hazard map. In areas designated as Zone AO where a depth is not specified on the map, the depth is taken as equal to 2 feet. The DFE is the locally adopted regulatory flood elevation. If a community regulates based on the FIRM, the DFE is identical to the BFE. If a community chooses to regulate based on a different flood hazard map, a lower frequency flood, or adds freeboard, the DFE must be at least as high as the BFE.

Detailing: Design practice of using structural and architectural drawings and specifications to arrange, configure, and connect structural and nonstructural building components of a building system. Design details convey to the contractor exactly how the structural and nonstructural components of a building should be built.

Development: “Any man-made change to improved or unimproved real estate, including but not limited to buildings or other structures, mining, dredging, filling, grading, paving, excavation or drilling operations or storage of equipment or materials” (44 CFR § 59.1).

Elevation Certificate: An NFIP administrative tool used to document elevation and other information necessary to determine compliance with a community’s floodplain management requirements, determine proper insurance premium rates, or support requests for Letters of Map Change (LOMCs). FEMA Form 086-0-33.

Enclosure or enclosed area: An area below an elevated building that is enclosed by walls on all sides. The NFIP does not explicitly define “enclosure,” but it is mentioned in the definition of “lowest floor.” Enclosures may be formed by foundation perimeter walls (crawlspace), framed walls, or breakaway walls. Also defined in ASCE 24-14 as the “confined area below the DFE, formed by walls on all sides of the enclosed space.”

Existing construction (may also be referred to as existing construction/structures): For the purposes of determining flood insurance rates, structures for which the “start of construction” commenced before the effective date of the FIRM or before January 1, 1975, for FIRMs effective before that date. “Existing construction” may also be referred to as “existing structures” (44 CFR § 59.1). Also defined in ASCE 24-14 as “any structure for which the start of construction commenced before the effective date of the first floodplain management code, ordinance, or standard adopted by the authority having jurisdiction.”

Flood Hazard Boundary Map (FHBM): “Official map of a community, issued by the Federal Insurance Administrator, where the boundaries of the flood, mudslide (i.e., mudflow) related erosion areas having special hazards have been designated as Zones A, M and/or E” (44 CFR § 59.1).

Flood Insurance Rate Map (FIRM): “Official map of a community, on which … [FEMA] has delineated both the special hazard areas and the risk premium zones applicable to the community” (44 CFR § 59.1).
**Flood Insurance Study (FIS)** (flood elevation study): “An examination, evaluation and determination of flood hazards and, if appropriate, corresponding water surface elevations, or an examination, evaluation and determination of mudslide (i.e., mudflow) and/or flood-related erosion hazards” (44 CFR § 59.1). The FIS is the official report provided by FEMA that contains the FIRMs, the Flood Boundary and Floodway Map (if applicable), the water surface elevations of the base flood, and supporting technical data.

**Flood protection level**: Elevation to which flood protection measures are designed. The flood protection level is the most restrictive of (1) the BFE plus the prescribed amount of freeboard specified in ASCE 24, (2) the design flood elevation (DFE) if a different flood is used for regulatory purposes, and (3) the elevation relative to the BFE specified in local floodplain management regulations.

**Flood shield**: Removable or permanent, substantially impermeable protective cover or panel for openings in the portions of a dry floodproofed building that are below the flood protection level (e.g., doors, windows, and louvers).

**Floodplain or flood prone area**: “Any land area susceptible to being inundated by water from any source” (44 CFR § 59.1).

**Floodproofing, dry**: “Any combination of structural and non-structural additions, changes, or adjustments to structures which reduce or eliminate flood damage to real estate or improved real property, water and sanitary facilities, structures and their contents” (44 CFR § 59.1). Referred to simply as “flood proofing” in 44 CFR § 59.1. Further defined in ASCE 24-14 as “a combination of measures that results in a structure, including the attendant utilities and equipment, being water tight, with all elements substantially impermeable and with structural components having the capacity to resist flood loads.”

**Floodproofing, wet**: “Floodproofing method that relies on the use of flood damage-resistant materials and construction techniques in areas of a structure that are below the elevation required by this standard by intentionally allowing those areas to flood” (ASCE 24-14). The NFIP does not define wet floodproofing. Wet floodproofing measures allow areas to flood in such a way that damage to a structure and its contents is minimized by using specific design, construction, and planning measures outlined in Technical Bulletin 7, *Wet Floodproofing Requirements for Structures Located in Special Flood Hazard Areas*.

**Floodproofing Certificate for Non-Residential Structures**: An NFIP administrative tool that documents certification by a registered professional engineer or architect that the design and methods of construction of a non-residential building are in accordance with accepted standard of practices for meeting a community’s floodplain management requirements for floodproofing. This documentation is required for both floodplain management requirements and NFIP flood insurance rating purposes. FEMA Form 086-0-034.

**Flow diversion**: Change in the course of flood flow when it encounters an object or structure. Diversion can be accompanied by an increase in the local flood level and/or flood velocity when the blockage is large relative to the area through which the flow would otherwise pass.

**Hydrodynamic loads**: “Loads imposed on an object [such as a building or foundation element] by water flowing against and around it” (ASCE 24-14). Examples are positive frontal pressure against the structure, drag effect along the sides, and negative pressure on the downstream side. The magnitude of hydrodynamic load varies as a function of the square of velocity and other factors.

**Hydrostatic loads**: “Loads imposed on an object [or a surface, such as a wall or floor slab] by a standing mass of water” (ASCE 24-14). Hydrostatic loads can be caused by slowly moving masses of water. Hydrostatic load increases as water depth increases.
Limit of Moderate Wave Action (LiMWA): “The inland limit of the area affected by [breaking] waves greater than 1.5 feet” (FEMA Procedure Memorandum No. 50). FEMA began delineating the LiMWA on coastal FIRMs in 2009.

Lowest floor: Lowest floor of the lowest enclosed area of a building, including basement. An unfinished or flood-resistant enclosure that is used solely for parking of vehicles, building access, or storage in an area other than a basement area is not considered a building’s lowest floor, provided the enclosure is built in compliance with applicable requirements.

Mixed-use building: Building that has both residential and commercial or other non-residential uses. The term does not include multi family residential buildings that have ancillary areas but no non-residential uses.

Net open area: Permanently open area of a non-engineered flood opening.

New construction (may also be referred to as new construction/structures): “… For floodplain management purposes, new construction means structures for which the start of construction commenced on or after the effective date of a floodplain management regulation adopted by a community and includes any subsequent improvements to such structures” (44 CFR § 59.1). Further defined in ASCE 24-14 as “structures for which the start of construction commenced on or after the effective date of the first floodplain management code, regulation, ordinance, or standard adopted by the authority having jurisdiction, including any subsequent improvements to such structures. New construction includes work determined to be substantial improvement.”

Non-residential building: Building that has a commercial or other non-residential use.

Opening, engineered: Opening, with moving parts, used to meet the requirement in 44 CFR § 60.3(c)(5) that is “certified by a registered professional engineer or architect” for meeting the requirement in 44 CFR § 60.3(c)(5) to “be designed to automatically equalize hydrostatic flood forces on exterior walls by allowing for the entry and exit of floodwaters.”

Opening, non-engineered: Opening, without moving parts, used to meet the prescriptive requirement in 44 CFR § 60.3(c)(5) to provide “a total net area of not less than one square inch for every square foot of enclosed area subject to flooding.”

Passive: Dry floodproofing measures or dry floodproofing systems that do not require human intervention or action before the onset of flooding to be effective (e.g., specially designed doors that are sealed when closed, designed window systems, flood shields that are designed to close automatically when triggered by rising floodwater).

Primary frontal dune: “A continuous or nearly continuous mound or ridge of sand with relatively steep seaward and landward slopes immediately landward and adjacent to the beach and subject to erosion and overtopping from high tides and waves during major coastal storms. The inland limit of the primary frontal dune occurs at the point where there is a distinct change from a relatively steep slope to a relatively mild slope” (44 CFR § 59.1).

Registered design professional: Individual who is registered or licensed to practice his or her design profession (e.g., architect, engineer, land surveyor) as defined by the statutory requirements of the professional registration laws of the state or jurisdiction in which a project is to be constructed.

Residential building: Building designated for habitation. Ancillary areas that serve only residents are residential ancillary areas. They include laundry facilities, storage rooms, mail rooms, recreational rooms, parking garages and exercise facilities.
Special Flood Hazard Area (SFHA): Area subject to flooding by the base flood (1-percent-annual chance flood) and shown on Flood Insurance Rate Maps (FIRMs) as Zones A, AO, AH, A1-30, AE, A99, AR, AR/A1-30, AR/AE, AR/AO, AR/AH, AR/A, VO, or V1-30, VE, or V (see “area of special flood hazard” in 44 CFR § 59.1).

Standard residential garage door: A door, typically up to 18 feet wide by up to 8 feet tall, intended for use in a residential garage for vehicular access and normally expected to be operated less than 1,500 cycles per year.

Structure: For floodplain management purposes, “a walled and roofed building, including a gas or liquid storage tank, that is principally above ground, as well as a manufactured home” (44 CFR § 59.1).

Substantial Damage: “Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before damaged condition would equal or exceed 50 percent of the market value of the structure before the damage occurred” (44 CFR § 59.1).

Substantial Improvement: “Any reconstruction, rehabilitation, addition, or other improvement of a structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the “start of construction” of the improvement. This term includes structures that have incurred “substantial damage,” regardless of the actual repair work performed. The term does not, however, include either:

1. Any project for improvement of a structure to correct existing violations of state or local health, sanitary, or safety code specifications which have been identified by the local code enforcement official and which are the minimum necessary to assure safe living conditions or
2. Any alteration of a ‘historic structure,’ provided that the alteration will not preclude the structure’s continued designation as a ’historic structure.’” (44 CFR § 59.1).

Substantially impermeable: The use of materials and techniques that restrict the passage of water and seepage through pathways (joints, cracks, openings, channels) and points of entry and that limits the accumulation of water during flooding. According to ASCE 24 and the U.S. Army Corps of Engineers (USACE), a structure is considered substantially impermeable if the maximum accumulation of water is not more than 4 inches in a 24-hour period without relying on devices for the removal of the water (USACE, 1995).

Variance: “Grant of relief by a community from the terms of a flood plain management regulation” (44 CFR § 59.1).

Wave reflection: Return or redirection of a wave striking an object.

Wave runup: Rush of water running up a slope or structure following wave breaking.

Zone A: Flood zones shown on FIRMs as Zone A, AE, A1-30, AH, AO, A99, and AR.

Zone V: Flood zones shown on FIRMs as Zone V, VE, V1-30, and VO.
6 Supplemental Information

6.1 How to Obtain Technical Bulletins

Order Technical Bulletins at no charge from the FEMA Publications Warehouse by:

- Calling 1-800-480-2520, Monday-Friday, 8 a.m.-5 p.m. Eastern Time
- Faxing a request to 1-719-948-9724
- Sending an email to FEMApubs@gpo.gov

6.2 How to Submit Comments on the Technical Bulletins

FEMA welcomes your comments and recommendations on the Technical Bulletins and may include, for example:

- Requests for clarifications of the guidance in the Technical Bulletins
- Requests for additional guidance
- Recommendations for new Technical Bulletins

Send your comments to:

DHS/FEMA
ATTN: Federal Insurance and Mitigation Administration,
Risk Management Directorate – Building Science Branch
400 C Street, S.W., Sixth Floor
Washington, DC 20472-3020

6.3 How to Get More Information

For questions on any of the Technical Bulletins, email the Building Science Helpline at FEMA-buildingsciencehelp@fema.dhs.gov or call 1-866-927-2104.

For additional guidance on NFIP regulatory requirements, contact your NFIP State Coordinating Agency (www.floods.org) or the FEMA Regional office in your Region (see Section 6.4).

6.4 FEMA Regional Offices

The locations of FEMA Headquarters and the 10 FEMA Regional Offices are shown in Figure 3, and addresses and telephone numbers are listed in Table 3. Staff members of the FEMA Regional Offices for your area can provide you with more information about the NFIP and Technical Bulletins.
Figure 3: Locations of FEMA Headquarters and 10 FEMA Regional Offices

### 7 Index of Key Words and Subjects in the Technical Bulletins

The numbers in the index indicate the Technical Bulletin number.

- accessory structures, 1, 5, 7
- ancillary area, 3, 6
- basement, definition of, 1, 3, 5, 6
- basement foundation, with lowest openings at the BFE, 10
- below-grade parking considered a basement, 6
- in Zone A and Zone V, when allowed, when prohibited, requirements for, 6
- best practices for corrosion resistance, 8
- best practices for crawlspace foundations in the SFHA, 11
- bracing, see foundation, bracing breakaway wall
- failure modes, 9
- in Zone A, opening requirements, 1
- in Zone A, made of flood damage-resistant materials, 2, 9
- in Zone V, made of flood damage-resistant materials, 2, 5, 9
- in Zone V, opening requirements, 1, 5
- insurance considerations, 5, 9
- NFIP regulatory requirements, 9
- specifications for NFIP-compliant construction, 9
breaking wave, impact on vertical surface, 9
building codes and standards, 1, 3, 4, 5, 6, 8, 9
bulkheads, as possible obstructions in Zone V, 5
community permitting, administrative
options for, 10
continuous load path, importance of selecting proper
connectors and fasteners, 8
corrosion
classes of building exposure to, 8
debates of, 8
identifying high-risk buildings, 8
light gauge metal connectors, 8
planning for, 8
rates of, 8
corrosion-resistant materials for metal connectors
and fasteners, 8
crawlspace / perimeter foundation walls
foundation, 10, 11
NFIP requirements for construction, 11
openings, 1
Decks, porches and patios, as possible obstructions
in Zone V, 5
detached garages, as possible obstructions, elevation
requirement in Zone V, 5
drainage (site) considerations, 5, 11
dry floodproofing, 3, 6
building utility systems and equipment, 3, 6
design process, 3
planning considerations, 3
points of entry, 6
seepage, 3, 6
Elevation Certificate
documentation of engineered openings, 1
engineered openings with certification reports, 1
engineered openings with individual
certifications for specific buildings, 1
use of engineered openings 1
elevators
attached to or underneath Zone V structures, 5
components, location of in relation to the BFE, 4
electrical equipment, location of in relation to
the BFE, 4
insurance considerations, 4
types of, 4
enclosed areas, 1, 2, 4, 5, 9
use of enclosed areas, 1, 5, 9
equipment and tanks
in Zone V, as possible obstructions, 5
erosion control structures
in Zone V, as possible obstructions, 5
fences and privacy walls
in Zone V, as possible obstructions, 5
fill
areas where prohibited, 5, 10
as possible obstruction beneath or around
buildings in Zone V, 5
placed to remove land from the SFHA, 10
proper placement of, 10
float switch, use of in flood areas (for elevator cab), 4
flood forces on buildings, 1, 3, 4, 5, 6, 9, 10, 11
flood insurance considerations, 1, 2, 3, 4, 5, 6, 7, 9,
10, 11
flood damage-resistant
elevator components, use of, 4
flooring materials, 2
materials, 2, 8, 11
materials, classifications, 2
wall and ceiling materials, 2
flood loads, 3, 6
flood openings, see “openings”
flood protection level, 3, 6
flood shields, 3, 6
floodproofing
below-grade parking beneath non-residential and
mixed-use buildings, design requirements for, 6
certificate, non-residential, 3
Emergency Operations Plan, minimum
acceptable, 3
Inspection and Maintenance Plan, 3
recognition of for insurance rating purposes, 3, 6
Floodproofing Certificate, 3, 6
foundation
- bracing, as possible obstructions in Zone V, 5
- flood risk, summary table, 10
- in Zone A, 1
- openings in Zone A, size, how to calculate, 1
- perimeter walls (crawl space), 1
freeboard, recommendations, 3, 10
free of obstruction
- designing a foundation system in Zone V, 5
- requirements in Zone V, 5
functionally dependent use, 7
galvanizing, 8
garage doors, 1, 5, 7, 9
- to meet the openings requirement, 1
garages
- attached to non-residential structures, 7
- attached to residential buildings, 1, 7
- below-grade, 6
- detached, 1, 5, 7
grade beams, as possible obstructions in Zone V, 5
high hazard area, safety and access in, 3, 5
historic buildings, 7
hydrodynamic forces, 1, 3, 4, 5, 6, 9, 11
hydrostatic forces, 1, 3, 4, 6, 10, 11
hydrostatic loads or pressure, equalized by
- openings, 1
insect screening, for below building
- enclosures, 1, 5, 9
insurance coverage for basement flooding,
- restrictions, 10
lattice work, for below-building enclosures, 2, 9
louvers, for below-building enclosures, 5
lowest floor, definition of, 1, 3, 5
mixed-use building, definition of, 3, 6
- building utility systems and equipment, 3, 6
- non-residential building, definition of, 3, 6
Non-Residential Floodproofing Certificate,
- how to fill out, 3
openings
- engineered openings, 1
- for foundations and enclosures in Zone A, 1
- non-engineered openings, 1
- pre-engineered below-grade crawlspace foundation
guidance, 11
pools, see swimming pools
preservative-treated wood, chemicals used and
corrosion, 2, 8
professional certification, 5, 10
- sample form, 10
reasonably safe from flooding
- defined, 10
- NFIP regulations concerning, 10
requirements, additional for below-grade
crawlspaces, 11
restroom buildings and comfort stations, 5
safety factor for foundation openings, 1
salt spray from breaking waves, 8
screening in Zone V, made of flood-resistant
materials, 2
septic systems, on-site, 5
shear walls, 5
slabs, slabs-on-grade 5, 10
spas in Zone V, 5
stem wall foundation, 1, 10
substantially impermeable, 3, 6
Substantial Damage, foundation wall openings
requirement, 1
Substantial Improvement, foundation wall openings
requirement, 1
- sump pump, requirements, 3, 10
swimming pools in Zone V, 5
U.S. Army Corps of Engineers, Flood Proofing
Regulations (1995), 3
utilities; access, chase, and ventilation
- openings, 1, 3, 5, 11
utilities, building systems, 3, 6
variances from NFIP requirements, 7
issuance in designated floodways, 7
wet floodproofing
allowable structures and uses, 7
definition of, 7
engineering considerations, 7
flood insurance implications, 7
planning considerations, 7
